Cocker's

ARITHMETICK:

BEING

A plain and familiar Method, faitable to the meanest Capacity, for the full Understanding of that incomparable Art, as it is now taught by the ablest School-Masters in CITY and COUNTRY,

COMPOSED

By EDWARD COCKER, late Practitioner in the Arts of Writing, Arithmetick, and Engraving: Being that so long fince promised to the World.

Perused and Published,

By JOHN HAWKINS, Writing-Master near St. George's Church in Southwark, by the Author's correct Copy, and commended to the World by many eminent Mathematicians and Writing Masters in and near London.

The FORTY-FIFTH EDITION, carefully Corrected and Amended

By GEORGE FISHER, Accompt. Licensed Sept. 3. 1677. Roger L'Estrange.

LONDON:

Printed for EDWARD MIDWINTER, at the Three Crowns and Looking-Glass in St. Paul's Church-Tard.

To his much honoured Friends Manwaring Davies of the Inner Temple, Esq and Mr. Humphry Davies of St. Mary Newington-Butts, in the County of Surry.

John Hawkins, as an Acknowledgment of unmerited Favours) humbly dedicatesh this Manual of Arith-

metick.

To the READER.

Courteous Reader,

Having had the Happiness of an intimate Acquaintance with Mr. Cocker in his Life-time, often follicited him to remember his Promise to the World, of publishing his Arithmetick; (but for Reasons best known to himself) he refused it; and after his Death) the Copy falling accidentally into my Hand) I thought it not convenient to fmother a Work of fo confiderable a Moment, not questioning but it might be as kindly accepted, as if it had been presented by his own Hand. The Method is familiar and easy, discovering as well the Theorick as the Practick of that necessary Art of Vulgar Arithmetick. And in this new Edition there are many remarkable Alterations for the Benefit of the Teacher or Learner, which I hope will be very acceptable to the World: I have also performed my Promise, in Publishing the Decimal Arithmetick, which finds Encouragement to my Expectation, and the Bookfellers too. I am thing to ferve thee.

John Hawkins.

PROEME or PREFACE.

B T the secret Instuence of Divine Providence, I have been instrumental to the Benefit of many, by Vertue of those useful Arts, Writing and Engraving: And do now with the same wonted Alacrity, cast this my Arithmetical Mite into the publick Treasury, beseeching the Almighty to grant the like Blessing to these as to my former Labours.

Seven Sciences supremely excellent,
Are the chief stars in Wisdom's Firmament:
Whereof Arithmetick is one, whose Worth
The Beams of Profit and Delight shine forth;
This crowns the rest, this makes Man's Mind compleat,
This treats of Numbers, and of this we treat.

I have been often desired by my intimate Friends, to publish something on this Subject, who, in a pleasing Freedom, have fignified to me, that they expelled it would be extraordinary. How far I have answered their Expectation, I know not; but this I know, That I have defigned this Work not extraordinary abstruse or profound; but have, by all Means possible, within the Circumference of my Capacity, endeavoured to render it extraordinary ufeful to all those, whose Occasions shall induce them to make use of Numbers. If it be objected, That the Books already published, treating of Numbers, are innumerable; I answer, That's but a small Wonder, since the Art is infinite. But that there should be so many excellent Tracts of Practical Arithmetick extant, and so little practised, is to me a great Wonder; knowing that as Merchandize is the Life of the Weal publick, fo Practical Arithmetick is the Soul of Merchandize. Therefore I do ingenuously profess, That in the Beginning of this Undertaking, the numerous Concerns of the honoured

A 3

Merchans

The Proeme or Preface.

Merchant find possesses my Consideration. And bow far I have accommodated this Composure for his most worthy Service, let his own profitable Expensive be Judge.

fa

Secondly, For your Service, most excellent Professors, whose Understandings soar to the Sublimity of the Theory and Practice of this noble Science, was this Arithmetical Trastate composed; which you may please to employ as a Monitor to instruct your young Tyroes, and thereby take Occasion to reserve your precious Moments, which might be exhausted that Way, for your more important Affairs.

Thirdly, For you the ingenious Off-spring of happy Parents, who will willingly pay the full Price of Industry and Exercise for those Arts and choice Accomplishments, which may contribute to the Felicity of your future State: For you, I say, (ingenious Praditioners) was this Work composed, which may prove the Pleasure of your Touth, and the Glory of your

Laftly, For you the pretended Numerifts of this Vapouring Age, who are more difingeously witty to propound unnecessary Questions, than ingenuously judicious to resolve such as are necessary; for you was this Book composed and published, if you will deny your selves so much as not to invert the Streams of your Ingenuity, but by studiously conferring with the Notes, Names, Orders, Progress, Species, Properties, Proprieties, Proportions, Powers, Affections, and Applications of Numbers delivered herein, become such Artists indeed, as you now only feem to be. This Arithmetick ingeniously observed and diligently pradis'd, will turn to good Account to all that shall be concerned in Accompts; fince all its Rules are grounded on Verity, and delivered with Sincerity; the Examples built up gradually from the smallest Consideration to the greatest; and all the Problems or Propositions, well weighed, pertinent and clear, and not one of them throughout the Tract, taken upon Truft, therefore now,

Zoilus and Momus, lie you down and die, For these Inventions your whole Force defie.

Courteous READER.

CHAP. I.

Notation of Numbers.

Rithmetick is an Art of Numbering or Knowledge. which teacheth to Number well. And there are divers Species and Kinds of Arithmetick and Geometry, the which we do intend to treat of in order, applying the Principles of the one to the Definition of the other. For as Greatness is the Subject of Geometry, so Number is the Subject of Arithmetick; and if so, then their first Principles and chief Fundamentals must have like Definitions; or at least some Congruency.

2. Number is that, by which the Quantity of any Thing is express'd or number'd; as the Unite is the Number by which the Quantity of the Thing is express'd or said to be one, and two by which it is named two, and ! half, by which it is named or called half, and the Root of 3, by which it is called the Root of 3, the like of any other.

3 Hence it is that Unit is Number; for the Part is 138 of the same Matter that is his Whole, the Unit is part of the Multitude of Units, therefore the Unit is of the same Matter, that is the Multitude of Units; but the Matter 148 of the Multitude of Units is Number; therefore the Matter of Unit is Number; for elfe, if from a Number 149 given no Number be subtracted, the Number given remaireth; as suppose 3 the given Number, if as some suppose, I be no Number, then if you subtract I from 154 3, there must remain 3 fil; which is very abfurd 166

4. Hence it will be convenient to examine from whence Number hath its Rife or Beginning Most Auchors main-170 tain, that Unit is the Beginning of Number, and it felf no 174 Number; but looking upon the Principles and Definitions 178 in the first Rudiments of Geometry, we shall find that the

1

F

Definition of a Point is in no way congruous with the Definition of an Unit in Arithmetick; and therefore Oge or Unit must be in the Bounds or Limits of Number, and consequently the Beginning of Number is not to be found in the Number 1; wherefore making Number and Magnitude congruent in Principles, and like in Definitions, we make and conflitute a Cypher to be the Beginning of Number, or rather the Medium between increasing and to decreasing Numbers, commonly called absolute or whole Numbers, and negative and fractional Numbers, between which nothing ean be imagin'd more agreeable to the Definition of a Point in Geometry; for as a Point is an Adjunct of Line, and it felf no Line, fo is a (0) Cypher an Adjunct of Number, and it felf no Number: And as a Point in Geometry cannot be divided or increased into Parts; fo likewise (o) cannot be divided or increased into Parts / for as many Points, though in Number infinite, do make no Line, so many (o) Cyphers, though in Number in-

finite, do make no Number. For the Line A B cannot be increased by the Addition of the Point C, neither the Number D be increased by the Addition of the (o) Cypher E; for if you add Nothing to 6, the Sum will be 6, (0) Cypher neither increasing nor diminishing the Number 6; but if it be granted that A B be extended or prolonged to the Point C, fo that A C be made a continued Line, then AB is increased by the Addition of the Point C. In like manner, if we grant D (6) be prolonged to E (0), fo that DE (60) be a continued Number, making 60, then 6 is augmented by the

Aid of (0) as conflicuting the Number (60) Sixty; and furthermore that I or Unit is material and a Number, and that (0) is the Beginning of Number, is proved by all Au thors, although directly; for the Tables of Signs and Tan gents prove one Degree to be a Number, because the Sine to of 1 Degree is 174524, (the Radius being 10000000) fi and the Beginning of the Table is (0), and it answered I oocoo, Oc.

e-

10

-מכ

10

ni-

we

of

oie

cen

ini-

ana

bau

t in

in-

-B

s Hence it is that Number is not Quantity discontinued, for that which is but one Quantity, is not Quantity difjune : (60) Sixty, as it is a Number, is one Quantity, viz. one Number (60) Sixty; therefore as it is a Number, it is not Quantity disjunct, for Number is some fuch Thing is Magnitude, as Humidity in Water: for as Humidity extends it felf through all and every Part of Water, so Number related to Magnitude, do extend it self and f through all and every Part of Magnitude. Alfo, as continued Water doth answer continued Humidity, so to a continued Magnitude doth answer a continued Number. As the continued Humidity of an intire Water, suffereth the fame Division and Distinction that his Water doch; so the continued Number suffereth the same Division and Distinction that his Magnitude doth. And thus much con-; fo cerning the Definition and Principles of Number and Magres : nitude. We come now to treat of. ake

6. The Characters or Notes by which Numbers are figni y'd, or by which a Number is ordinarily express'd; and they are these, viz. (0) Expher or Nothing, I Oac, 2 Two, 3 Three, 4 Four, 5 Five, 6 Six, 7 Seven, 8 Eight. 9 Nine. The Cypher, which tho' of itself it expresseth not any certain or known Quantity, yet is the Beginning or Root of Number, and the other 9 Figures are called figni-

ficant Figures or Digits.

7. In Number of any Sort, two Things are to be confi-

dered, viz. Notation and Numeration.

8. Notation teacheth how to describe any Number by certain Notes and Characters, and to declare the Value thereof being so described, that is by Degrees and Periods.

9. A Degree confilts of three Figures, viz. of three Places, comprehending Units, Tens, and Hundreds, fo 265 is a Degree, and the first Figure (5) on the right Hand, flands fimply for his own Value, being Units, or fo many Ones, viz. Five; the fecond in order from the Right, fignifies as many times Ten as there are Units contained in it, viz. Sixty; the Third in the fame Order fignifies fo many Hundreds as it contains Units, fo will the Expression of the Number be Three hundred fixty five, or.

10. A Period is when a Number confiles of more than 3 Figures or Places, and whole proper Order is to prick B 2

Hend

; and

r, and

II Au

d Tan

ne Sine

coco)

weren

EVERY

every third Place, beginning at the right Hand, and fo on to the Left; fo the Number 63452 being given, it will be diffinguished thus, 63.452, and expressed thus, Sixty three thousand, four hundred fifty two; likewise 4,578,236,782, being diffinguished as you fee, will be expressed thus; Four thousand, five hundred seventy eight Millions, two hundred thirty fix thousand, feven hundred eighty two.

11. Number is either Absolute or Negative.

12. Absolute or Intire, Whole, Increasing Number, is that by which annexing another Figure or Cypher, it becomes ten times as much as it flood for before; and if two Figures or Cyphers be annexed, it makes an hundred times I as much as it flood for before, &c. As if you annex to c the Figure 6 a Cypher, then it will be (60) Sixty; fo if ; two Cyphers are annexed, then it will be (600) Six hundred, and if you do annex to it (4) Four, then it will d be (64) Sixty four; and if you annex (78) Seventy eight, in it will be then (678) Six hundred seventy eight, &c.

12. A Negative, or Broken, Fractional, Decreating h Number, is that which by prefixing a Point or Prick to- th ward the left Hand, its Value has decreased from fo many . Units, to fo many tenth Parts of any Thing; and if a Point h and (0) Cypher, or Digit, he prefixed, it will be then fo many hundred Parts; and if a Point and two Cyphers or Digits be prefixed, its Value is decreased to be so many thousandth Parts; as if you would prefix before the Figure th 3 a Point (.) or Prick thus (.3), it is then decreased from 3 Units or 3 Integers, to 3 tenth Parts of an Unit or an Integer: And if you prefix a Point and Cypher thus (.03,) it is decreased from 3 Integers to 3 hundred Parts of an Integer; and by this Means 5 1. absolute, by prefixing of a Point, will be decreased to .5 1. negative, which is 5 tenth Parts of a Pound, equal in Value to 10 Shillings and fo by prefixing of more Cyphers or Digits, its Value is decreased in a decuple Proportion ad infinitum. As in the following Scheme, or rather Order of Numbers, we have placed (o) Cypher in its due Place and Order, as it is in the Beginning and Medium of Number; for going from (5) towards the left Hand, you deal with intire, absolute, whole, increasing Numbers.

three Increasing Numbers. Decreasing Numbers. 782, 29 | 876 | 543 | 256 | 2 1 0 1 2 | 345 | 678 | 976 | 3 | Four mm mmm mmm CXUXC mmm mmm mmm m dred mm mmm CX XC mmm mmm m XC mmm m!: CX XC mm T, 18 X

two But going from (o) the Place of Units towards the rights imes Hand, you meet with broken negative, fractional and dex to creafing Numbers. And hence it follows, that Multiplicaso if tion increaseth the Product in absolute Numbers, but de+ hun greafeth the Product in negative Numbers. Also Division will decreaseth the Quotient in whole Numbers, and increasethe ight, it in negative fractional Numbers.

14. An absolute, intire, whole, increasing Number. afing hath always a Point annexed towards the right Hand; and

to- therefore,

15. A negative, broken, decimal, decreafing Number. Point hich always a Point prefixed towards the left Hand, then When we express Integers of whole Numbers, as 5 Tounds, is or 5 Feet, 26 Men, we usually annex a Point or Prick after 1. feet. men. inch.

gure the Number thus, 5. 5. 26. 347. But when we express Decimals, or Numbers that are denied to be intire, or decreafing Numbers, we do commonly prefix a Point or Prick before the faid Decimal or decreasing Number thus (.1), that is three Tenths, or 2 Primes; (.03) that is 3 Hundredths, or 3 Seconds.

16 A whole or absolute Number is a Unit, or a composed Multitude of Units, and it is either a Prime or else

a compound Number.

17. Prime Numbers among themselves, are those which have no Mulcitude of Units for a common Meafurer, as 8 and 7, or 10 and 13, because not any Multitude of Units can equally measure or divide them withous a Remainder.

18. Compound Numbers amongst themselves, are those which have a Multitude of Units for a common Measurer; as 9 and 12, because 3 measures them exactly, and abbreviates them to three and four.

B 3

19. A broken Number commonly called a Fraction, is a Part or Parts of a whole Number, viz. A Part of an Integer, as \(\frac{1}{2} \) one Third, is one third Part of an Unit

20. A broken Number or Fraction, confifts of 2 Parts,

viz. the Numerator and the Denominator.

21. The Numerator and Denominator of a Fraction, are set one over the other, with a Line between them; and the Numerator is set above the Line, and expresseth the Parts therein contained.

Number placed below the Line, and expressent the Number of Parts into which the Unit or Integer is divided; as let \(\frac{3}{4}\) be the Fraction given, so shall 3 be the Numerator, and doth express or number the Multitude of Parts contain'd in this Fraction, for \(\frac{3}{4}\) is a Fraction compounded of Fourths or Quarters, and the Figure 3 in numbering thews us, that in that Fraction there are 3 of the 4th Parts or Quarters; also in the same Fraction \(\frac{3}{4}\) is the Denominator, and doth express the Quality of the Fraction, viz. that that the whole or Integer is divided into 4 equal Parts.

23. A broken Number is either Proper or Improper; viz. proper when the Numerator is less than the Denominator, for \(\frac{1}{2}\) is a perfect proper Fraction; but an improper Fraction hath its Numerator greater, or at least equal to to the Denominator, thus \(\frac{1}{2}\) is an improper Fraction, the

Reason is in given in the Definition.

24. A proper broken Number, is either Simple or Compound, viz. Simple when it hath one Denomination, and Compound when it confifteth of divers Denominations; it $\frac{1}{12} = \frac{1}{12} \frac$

25. When a fingle broken Number or Fraction hath for his Denominator a Number confifting of a Unit in the first Place towards the left Hand, and nothing but Cyphers from the Unit towards the right Hand, it is then the more

aprly

Sn, is

per : omi-ODET l to

omand

; it Sinone

omrefons 14C-

n. for irst

om ore yis apply and rightly called a decimal Fraction; under this Mead are all our decreasing Numbers placed, and in our 13th Definition, called Negatives; and by the Order there prescribed, we order them to be Decimals, by figning a Prick or Point before them, or the Numerator, rejecting the Denominator: Therefore according to our last Rule, To Tage, are faid to be Decimals; and a Decimal Fraction may be expressed without its Denominator (as before) by prefixing a Point or Prick before the Numerator of the faid Fraction, and then shall the former Fractions. 25 -5 and 1-25 fland thus, .5, and .025.

But ofcentimes, as in the second and fourth Fractions To and -25, a Prick or Point will not do without the Help of a Cypher or Cyphers prefixed before the fignificant Figures of the Numerator, and therefore when the Numerator of a decimal Fraction confifteth not of fo many Places as the Denominator hath Cyphers, fill up the void Places of the Numerator with prefixing Cyphers before the fignificant Figures of the Numerator, and then fign for a Decimal, fo shall - be os, and - will be .025, and 72 will be .0072. Now by this we may eafily difcover the Denominator having the Numerator, for always the Denominator of any decimal Fraction confifts of fo many Cyphers, as the Numerator hath Places, with an Unit prefixed before the faid Cypher, viz. under the Point or Prick.

26. A decimal Number or Fraction, is expressed by Primes, Seconds, Thirds, Fourths, &c. and is a Number decreasing. Here instead of natural and common Fractions, as i of a Thing, we order the Thing or Integer into Primes, Seconds, Thirds, Fourths, Fifths, &c. that our

Expression may be consonant to our former Order.

27. In decimal rithmetick, we always imagine that all intire Units, Integers, and Things, are divided first into ten equal Parts, and these Parts so divided we call Primes; and Secondly, we divide also each of the former Primes into other ten equal Parts, and every of these Divisions we call Seconds; and Thirdly, we divide each of the faid Seconds into ten other equal Parts, and those so divided, we call Thirds; and fo by decimating the former, and subdecimating these latter, we run on ad infinitum.

CO

t

Chap. 1.

28. Let a Pound Sterling, Troy-weight, Averduvoisweight, Liquid measure, Dry-measure, Long-measure, Time. Dozen, or any other Thing or Integer be given to be decimally divided: In this Notion premised, we ought to let the first Division be Primes, the next Division Seconds, the next Thirds, &c. So one Pound Seerling being 20 Shillings, when divided into ten equal Parts, the Value of each Part will be 2 Shillings, therefore one Prime of a Pound Sterling will ftand thus (.1), which is in Value 2 Shillings; 2 Primes will fland thus (.3), and that is in Value 6 Shillings. Again, a Prime or .1 being divided into ten equal Parts, each of those Parts will be one Second, and is thus expressed (.o1.) and its Value will be found 2 d. Farthing, and -6 of a Farthing; and fo will .05 fignify one Shilling or five Seconds. And if .or be divided into ten other equal Parts, each of those Parts so divided will be Thirds, and will fland thus cor, and its Value will be found to be 96 of a Farthing. or 100 of a Farthing, and .000 Thirds will be 2 d. and .64 of a Farthing, or of a Parthing, &c. So that .375, will be found to represent 7 s. 6 d. for the 3 Primes are 6 Shillings, and the 7 Seconds are 1 s. 4 d. and - of a Penny, and the 4 Thirds are I Penny, - of a Penny, both which added together make 7 s. 6 d.

29. If you put any Bulk or Body, reprefenting an Integer, if it be decimally divided, then the Parts in the first Decimation are Primes, the next Seconds, and the next Decimation is Thirds, the next Fourths, &c. As let there be given a Bullet of Lead, or fuch like, whose Weight let it be 50 1. Troy, this is call'd a Unit, Integer, or Thing; then will the like Weight and Matter make 10 other, the which together will be equal to 50 1, and will weigh each of them 5 1, a-piece; take of the fame Marter, and equal to 5 l. make 10 more, then each of those weigh 6 Ounces a-piece; alfo, if again you take 6 Ounces, and thereof make 10 other small Bullets, each of them will weigh 12 Penny-weight Troy; and thus have you made Primes, Seconds, and Thirds, in respect of the Integer, containing 50 l. Troy weight; fo that 5 Primes is equal to the half Mass and 2 Primes, and 5 Seconds, is a Quarter of the Mass; and therefore one of the first Division, p. I.

2 of the second Division, and 5 of the third Division, will be equal in Weight to halt a Quarter of the Mass, and contains 6 l. 3 Ounces.

39. When a Decimal Fraction followeth a whole Number, you are to separate or part the Decimal from the whole Number by a Point or Prick; so if 75 followed the whole Number 32, set them thus, 32 75. You shall find that diverse Authors, have diverse ways in expressing mixe Numbers, as thus, 32 75, or 32 75, or 32 75, but you will find that 32.75 thus placed and expressed, is the fictest for Calculation.

31. A mixt Number hath two Parts, the whole, and the broken; the whole is that which is composed of Integers, and the broken is a Fraction annexed thereunto. So the mixt Number $36 - \frac{8}{7}$ being given, we say, that 36 is the whole Number, which is composed of Integers; and the $\frac{8}{7}$ is the broken Number annex d, which she weth that one of the former Integers (of that 36) being divided into 12 Parts, $-\frac{8}{2}$, doth express 8 of those 12 Parts more, bealonging to the said 36 Integers.

32. Denominative Numbers are of one, or of many, and those are of divers Sorts and Kinds, viz. Singular, called Unit, as 1; and Plural a Multitude, as 2; 3, 4, 5; Single, of one Kind only called Digits, as 1, 2, 3, 4, 5, 6, 7, 8, 9; and Compounds of many, 10, 11, 12, 67c. 1.2,

367, Oc.

Proportional, as Single, Multiple, Double, Triple, Quadruple, &c Denominate, as Pounds, Shillings, Pence; Undenominate, as 1, 2, 3, &c. Perfect, as 6, 28, 496, 8128, 130816, 2096128, &c whose Parts are equal to the Numbers; imperfect, unequal, and more than the Sum, as 12, to 1, 2, 3, 4, 6; imperfect, unequal and more than the Sum, as 8 to 1, 2, 4. Numbers Commensurable and Incommensurable, as 12 and 9, are Commensurable, because 3 measures them both; but 16 and 17 are Incommensurable, because no one common Number or Measure can measure them; Linear, in Form of a Line, as Superficial, in Form of a Superficies or Plane, as :::::

or : : , &c. and Number cubical or folid, in Form of a Cube. Those two Latter are otherwise called Figurative Numbers: There are also other Numbers called Tabu-

B 5

las,

Chap. 2.

lar, as Sines, Tangents, Secants, &c. Others that be called Logarith metick, or borrow'd Numbers, fitted to Proportion for Ease, and speedy Calculation of all manner of Questions.

CHAP. II.

Of the Natural Divisions of Integers, and the Several Denominations of the Parts.

I. A ND that we may advance methodically herein, we will begin with the main Pillars on which Arithmetick is founded, viz. the feveral Species of that Art: But first,

Of M ney, Weights, &c.

2, The least Denomination or Fraction of Money used in England is a Farthing, from which is produced the tollowing Table, called the Table of Coin, viz,

And therefore,

1 Farth.
4 Farth.
12 Pence.
20 Shil.

And therefore,
1 Farthing \(\begin{align*} \lambda & \lambda

The First of these Tables, viz. that on the less Hand, is plain and easy to be understood, and therefore wants no Direction. In the second Table above the Line, you have 1 l. 20 s. 12 d. 4 grs whereby is meant, That a Pound is equal to 20 Shillings, and I Shilling is equal to 12 Pence, and I Penny equal to 4 Farthings; under the Line is 1 l. 20 s. 240 d. 960 grs. which signifies 1 l. to contain 20 Shillings, or 240 Pence, or 960 Farthings; in the second Line below that is 1 s. 12d 48 grs. the First standing under the Denomination of Shillings, whereby is to be noted, that I Shilling is equal to 12 Pence or 48 Farthings; and likewist that below that, one Penny is equal in Value to four Farthings; understand the like Reason in all the sollowing Tables of Weight, Measure, Time, Motion, and Dozen.

the

Of.

3. The least Fraction or Denomination of Weight used iu England, is a Grain of Whear gathered out of the Middie of the Ear, and well dried; from whence are produced these following Tables of Weight, called Tr y-Weight.

(24 Artificial Grains 32 Grains of Wheat 24 Artificial Gra
1 Penny-weight
1 Ounce 24 Artificial Grains 20 Penny-weight I Pound Troy-weight. 12 Ounces

And therefore,

p. w. grains. l. oun. 1- 12-20-1- 12- 240-5760 1-20-480

Troy Weight serveth only to weigh Bread, Gold, Silver, and E'ectuaries; it also regulateth and prescribeth a Form how to keep the Money of England at a certain Standard.

Of Apothecaries Weight.

4. The Apothecaries have their Weights deduced from Troy Weight, a Pound Troy being the greatest Integer, a Table of whose Division and Subdivision followeth, viz:

And therefore,

1. oun. drams scrup. gr. 1 Pound
1 Ounce | 2 | S | Drams | 1-12-8-3--23 |
1 Ounce | 8 | Drams | 1-12-96-288-5760 |
1 Dram | 2 | Scruples | 1-8-24-486 |
1 | Scruple | 2 | Grains | 1-3-60

5. Thus much concerning Troy-Weight, and its Derivative Weights; besides which, there is another Kind of Weight used in England, known by the Name of Averdupois Weight, (1 Pound of which is equal to 14 Ounces 12 Penny-weight Troy Weight) and it fer vest to weigh all Kinds of Grocery-wares, as also Butter, Cheese, Flesh, Wax, Tallow, Rosin, Pitch, Lead, Gre. the Table of which is as

F

Note, That in some Counties the Wey is 256 l. Averdupois, as is the Suff. lk Wey; but in Effect there is 336 l. in a Wey.

Chap. 2. and Meafures. 15 And note, that the Yard, as also the Ell, is usually divided into Quarters, and each Quarter into 4 Nails. Note also, That a Geometrical Pace is 5 Feer, and there are 1056 fuch Paces in an English Mile. o. The Parts of the Superficial Measures of Land are fuch as are mentioned in the following Table, viz. A Table of Land Measure. u (I Rood, or Quarter of 40 Square Poles or pint Perches an Acre 4 Ropds By the foregoing Table of Long Measure, you are in--512 formed what a Pole or Perch is; and by this, that 40 fquare -256 Perches is a Rood. Now a square Perch is a Superficies ve-- 51. ry aprly resembled by a square Treneher, every Side there-- 25 of being a Perch of 5 Yards and a Half in Length, 40 of --6. them is a Rood and 4 Roods an Acre So that a Super---1 ficies, that is 40 Perches long, and 4 Broad is an Acre of Land, the Acre containing in all 160 square Perches. 10. The least denominative Part of l'ime, is one Mie is oft nute, the greatest Integer being a Year, from whence is produced this Table of Time. I Minute 1 Minute 60 Minutes I Hour I Day r 24 Hours I Day natural 7 Days 1 Month 4 Weeks I Year 13 Months, 1 day, 6 hours Rod But the Year is usually divided into twelve unequal Calendar Months, whose Names, and the Number of Days they contain, are as follows, viz. arlycom So that the Year containeth Days 365 Days, and 6 Hours; but the Days 31 6 Hours are not reckon'd but Fanuary 31 July 190080 31 only every fourth Year, and then February 28 | August 23760 March 31 Septemb. 30 there is a Day added to the latter 30 October 31 End of February, and then it con-April 31 Novemb. 30 raineth 29 Days; and that Year May

30 Decemb. 31 is called Leap-Year, and contain-

And here note, That as the Hour is divided into 60 Minutes, so each Minute is sub-divided into 60 Seconds, and each Second into 60 Thirds, and each Third into 60 Fourths, Oc.

The Tropical Year, by the exactest Observation of the most accurate Astronomers, is sound to be 365 Days, 5

Hours, 49 Minutes, 4 Seconds, and 21 Thirds.

CHAP. III.

Of the Species or Kinds of Arithmetick.

Here are several Species of this Art; and which may be termed either Natural, Artificial, Analytical, Algebraical, Lineal, or Instrumental: But what we are now to treat upon, relates to the fingle Parts of Natural Arithmetick, fo far as concerns Numeration; of which there are also four Kinds, viz. Addition, Subtraction, Multiplication, and Division.

CHAP. IV.

Addition of Whole Numbers.

Ddition is the Reduction of two or more Numbers, of like Kind, together into one Sum or Total, Or it is that by which divers Numbers are added together, to the End that the Sum or Total Value of them all may be discovered.

The first Number in every Addition is called the Addible Number; the other, the Number or Numbers added; and the Number invented by the Addition, is called the Aggregate or Sum, containing the Value of the Addition.

The Collation of the Numbers, is the right placing the Numbers given respectively to each Denomination, and the Operation is the artificial adding of the Numbers given together, in order to the finding out of the Aggregate of Sum.

2. In Addition place the Numbers given respectively the one above the other, in fuch fort, that the like Degree, Place, or Denomination, may stand in the same Series, viz. Units under Units, Tens under Tens, Hundreds under Hundreds, Ge. Pounds under Pounds, Shillings

6

2

I

f f

t

N

f

CO

5

Addition of, &c. Chap. 4. 17. under Shillings, Pence under Pence, &c. Yards under Yards, Feet under Feet, &c. 3. Having thus placed the Numbers given (as before) and drawn a Line under them, add them together, beginning with the leffer Denomination, viz. at the right Hand; and fo on, subscribing the Sum under the Line respectively: As for Example, Let there be given 3352, and 213, and 133, to be added together. I fet the Units in each particular Number under each other, and so likewise the Tens under the Tens, &c. and draw a Line under them, as in the Margent; then I begin at the Place of Units, and add them together upwards, faying, 3 and 3 are 6, and 2 makes 8, which I fet under the Line, 133 and under the same Figures added together; then I proceed to the next Place, being the Place of Tens, and add them in the same Manner as I did in the Place of Units, faying, 3 and 1 are 4, and 5 are 9, which I likewise set under the Line respectively; then I go to the Place of Hundreds, and add them up as I did the other, faying, I and 2 are 3, and 3 are 6, which is also fer under the Line; and laftly, I go to the Place of Thoufands, and because there are no other Figures to add to the Vum-3, I fet it under the Line in its respective Place, and so the Work is finished; and I find the Sum of the 3 given d to-Numbers to be 3698. 4. But if the Sum of the Figures of any Series exceedeth Ten, or any Number of Tens, subscribe under the same ldible the Excess above the Tens, and for every Ten carry one and to be added to the next Series towards the left Hand, and ggreso go on till you have finished your Addition; always remembering, that how great soever the Sum of the Figures the of the last Series is, it must all be set down under the d the Line respectively. So 3678 being given to be added to given 2357, I fer them down as is before directed, and as you are of fee in the Margent, with a Line drawn under them, then I begin and add them together, faying, 7 and 3678 ively 8 are 15, which is 5 above 10, wherefore I fer 5 2357 e Deunder the Line, and earry 1 for the 10 to be addfame ed to the next Series, faying, I that I carried and 6035 ndreds 5 is 6, and 7 are 13, wherefore I fet down 3, illings and unde

3.

the

, 5

may

ical,

are

eral

hich

Mul-

To

hem

I

and carry I (for the Ten) to the next Series; then Islay, I that I carried and 3 are 4, and 6 are 10, now, because it comes to just 10, and no more, I set 0 under the Line, and carry I for the 10 to the next, and say, I that I carried and 2 are 3, and 3 are 6, which I set down in its respective Place; thus the Addition is ended, and the total Sum of these Numbers is found to be 6035. Several Examples of this Kind follow.

354867 Numbers to) 573846 785946 be added (347205 Sum 2061864 748647 45346 Numbers to) 38074 Numbers to 455531 be added be added 76483 648400

ded 76483 648400 be added 8437 923 76 Sum 1939364 Sum 92856

5. If the Numbers given to be added, are contained us der divers Denominations, as of Pounds, Shillings, Pence and Farthings; or of Tuns, Hundreds, Quarters, Pounds &c. Then in this Case having disposed of the Numbers of each Denomination under other of the like Kind; begin ning at the least Denomination (minding how many of on Denomination do make an Integer in the next) and having added them up, for every Integer of the next greater De nomination that you find therein contained, bear an Uni in Mind to be added to the faid next greater Denominan on, expressing the Excess respectively under the Line; pro ceed in this Manner until your Addition be finished; th following Example will make the Rule plain to the Learner. Thus thefe following Sums being given to added, viz. 136 l. 13 s. 04 d. 2 grs. and 79 l. 074 10 d. 3 qrs. and 33 l. 18%. 09 d. 1 qr. alfo 15 l. 09 05 d. 0 qrs. The Numbers being disposed according to Order, will stand as in the Margent. Then I begin a Denomination of Farthings, and add them up, faying.

Chap. 4. and 3 are 4. and 2 makes 6. Now I confider that fix Farthings are I Penny 2 Farthings; wherefore I fer down the 2 Farthings in its Place under the Line; and keep I in Mind to be added to the next Denomination of Pence : -Then I go on, faying, I that I carfied and 5 are 6, and 9 are 15, and 10 are 25, and 4 are 29; now I

I. 136-13-04-2 79-07-10-39 33-18-09-1 15-09-05-0 265-09-05-2

confider that 29 Pence are 2 Shillings and 5 Pence, therefore I fet down 5 Pence in order under the Line, and keep 2 in Mind for the 2 Shillings to be added to the Shillings; then I go on faying, 2 that I carried and 9 are 11, and 18 are 29, and 7 are 36, and 13 are 49; then I confider that 49 Shillings are 2 Pounds and 9 Shillings, wherefore I fee the 9 Shillings under the Line, and carry the 2 for the 2 Pounds to the next and last Denomination of Pounds; and proceed, faying, 2 that I carried and 5 makes 7, and 3 are 10, and 9 are 19, and 6 are 25; then I fet down 5, and carry 2 for the 2 Tens; and proceed, faying, 2 that .I carry and 1 is 3, and 3 are 6, and 7 are 13, and 3 make 16, and I fet down 6, and carry I for the 10, and go on; faying, I that I carried and I are 2, which I fer in its Place under the Line, and the Work is finished: and thus I find the Sum of the aforesaid Numbers to be 265 l. 9 s. 5 d. 2 grs. Here is another Example in the Operation, of which the Learner must have an Eye to the Table of Troy-Weight. The Numbers given are 38 l. 7 oz. 13 p. w. 18 gr., and 50°l. 10 oz. 10 p. w. 12 gr. and 42 l. 08 oz. 05 %. w. 26 gr. And in order to the Addition thereof, I place them as you fee, and proceed to the Operation; faying, 16 and 12 are 28, and 18 are 46; now because 24 Grains make 1 Penny-weight, 46 Grains are 1 Penny-weight, and 22 1. cz. p.w. gr.

Grains, therefore I fet down 22, and 38--07-13-18 carrry I for the Penny-weight, and 5 makes 6, and 10 are 16, and 13 are 29, which is one Ounce and

50-10-10-12 42-08-05-16

9 Penny-weight. I set down 9 in 132-02-09-22 in Place under the Line, and carry to the Ounces, Laying, 1 that I carry and 8

The Proof of Addition. 6. Addition is proved after this Manner: When you have found out the Sum of the Number given, then feparate the uppermost Line from the rest with a Stroke of Daft of the Pen, and then add them all up again as you did before leaving out the uppermost Line; and having se done, add the new invented Sum to the uppermost Lin I you separated, and if the Sum of those two Lines be equal to the Sum first found out, then the Work is performed true, otherwise nor. As for Example ; Let us prove the first Example of Addition of Money, whose Sum we find to be 265 l. 95. 5 d. 2 grs. and which we prove thus;

Having separated the uppermost Number from the reft by a Line, as you fee in the Margent, then I add the fame together again, leaving out the faid uppermost Line, and the Sum thereof I fer under the first Sum or true Sum, which doth amount to 128 1. 16 s. 1 d. o grs. then again I add this new Sum to the uppermost Line that before was separated from the reft, and the Sum of those two is 265 h 09 s. 05 d. 2 grs. the fame with the first Sum, and therefore I conclude that the Operation was rightly performed.

7. The main End of Addition in Question resolvable thereby, is to know the Sum of several Debts, Parcels, In tegers, &c. some Questions may be these that follow.

Queft

th

al

A

f

4

Queft. I. There was an old Man whose Age was requied; to which he replied, I have 7 Sons, each having two Years between the Birth of each other, and in the 44th Year of my Age my eldeft Son was horn, which is now the Age of the youngest. I demand, What was the old Man's Age.

Now to resolve this Question, first set down the . Fathers's Age at the Birth of his first Child, which 44 was 44; then the Difference between the Oldeft and 12 the Youngest, which is 12 Years, and then the Age 44 of the Youngest, which is 44; and then add them all together, and their Sum is 100, the complean 100 Age of their Father.

Quest. 2. A Man lent his Friend at Several Times, these feveral Sums, viz at one Time 63 1. at another Time 50 L at another Time 48 1 at another Time 156 1. Now

I defire to know how much was lent him in all?

Serthe Sums lent one under another, as you fee in 62 the Margent, and then add them together, and you 50 ve the will find their Sum to amount to 317 1. which is the 48 find Total of all the feveral Sums lent, and fo much is 156 thus: due to the Creditor.

317 Quest. 2. There are two Numbers, the least whereof is 40, and their Difference 14. I defire to know what is the greater Number, and also 40 what is the Sum of them both? First fet 14 down the least, viz. 40 and 14, the Difference, and add them together, and their greateft 54 Sum is 54 for the greatest Number; then I 40 fet 40 (the leaft) under 54 (the greateft) and add them together; and their Sum is Sum 94 94, equal to the greatest and least Num-

Queft

Of Subtraction of whole Numbers.

Obtraction, is taking of a leffer Number out of a great an Ter of a like Kind, whereby to find out a third Num th ber, being or declaring the Inequality, Excess or Diffe for rence between the Numbers given; or Subtraction is the th by which one Number is taken out of another Number Su given, to the End that the Residue or Remainder may be gi known, which Remainder is also called the Rest, Re di mainder, or Difference of the Numbers given.

ainder, or Difference of the Numbers given.

2. The Number out of which Subtraction is to be made no must be greater, or at least equal with the other Numbe re given; the higher Number is called the Major, and the th lower, Minor; and the Operation of Subtraction being finished, the Reft or Remainder is called the Difference off

the Numbers given.

3. In Subtraction, place the Numbers given respective at ly, the one under the other, in such Sort as like Degrees the Places, or Denominations may stand in the same Series the viz. Units under Units, Tens under Tens, Pounds under an Pounds, drc. Feet under Feet, and Parts under Parts, O. 4.

This being done, draw a Line underneath, as in Addition. the 4. Having placed the Numbers given as is before diquerected, and draw a Line under them, subtract the lower as Number (which in this Case must always be less than the harmonic than the subtract the lower as the subtract the subtra Uppermost) out of the higher Number, and subscribe the Difference or Remainder respectively below the Line, and when the Work is finished, the Number below the Line,

will give you the Remainder.

As for Example, Let 364521 be given to be subtracted from 795836, I fet the leffer under the greater, as in the Margent, and draw a Line under them; then beginning at the right Hand, I fay, one out of 6, and there remains 5, which I fer in order under the Line; then I proceed to the next, faying, 2 from 3 refts 1, which I note also under the Line; and thus I go on till I have finished the

79583640 364521 pf

m an

431315

Work;

tur.

JIAP. T. Work; and then I find the Remainder or Difference to be

43 1315.

5. But if it so happen (as commonly it doth) that the lowermost Number or Figure is greater than the uppermost, then in this Case add ten to the uppermost Number, and Subtract the faid lowermost Number from their Sum, great and the Remainder place under the Line, and when you go to Sum the next Figure below, pay an Unit, by adding it thereto Office for the Ten you borrowed before, and subtract that from the higher Number of Figures, and thus go on till your mber Subtraction be suished. As for Example, Let 437503 be my be given, from whence it is required to subtract 153827, I Re dispose of the Numbers as is before directed, and as you fee in the Margent; then I begin, faying, 7 from 3 I can-nade not, but (adding 10 thereto) I fay, 7 from 13 and there mbe remains 6, which I fet under the Line in order; d the then I proceed to the next Figure, faying, 1 that 437503

being I borrowed and 2 is 3 from 0 I cannot, but 3 nce of from 10 and there remain 7, which I likewife fet down as before; then I that I borrowed 283676

crive- and 8 is 9, from 5 I cannot, but 9 from 15, and grees there remain 6; then 1 I borrowed and 3 is 4. from 7, and series there remain 3; then 5 from 3 I cannot, but 5 from 13, under and there remain 8; then 1 borrowed and 1 are 2, from s, 64, and there rest 2; and thus the Work is finished: After these Numbers are subtracted one from another, the Ine-ore disquality, Remainder, Excess, or Difference, is found to be lower 283676. Examples for thy farther Experience may be in these that follow.

be the

From 3469916 From 361977 Take 738642 5854 racted Reft 2731274

in the 6. If the Sum or Number to be fubtra ed is of several Denominations, place the leffer Sum below the greater, 95836 and in the fame Rank and Order, as is fliewed in Addition 64521 of the fame Numbers; then begin at the right Hand, and ake the lower Number out of the uppermost, if it be 31315 effer; but if it be bigger than the Uppermost, then borlow ar Unit from the next greater Denomination, and

P

turn it into the Parts of the less Denomination, and at those Parts to the Uppermost, noting the Remainder below the Line; then proceed and pay one to the next Denomi nation for that which you borrowed before, and proceed in this Order till the Work be finished. An Example this Rule followeth: Let 375 1. 13 s. 7 d. 1 gr. be give from whence let it be required to luberact 57 1. 16 s. 03 da 2 grs. In order whereunto, I place the Numbers as your fee in the Margent; and thus I begin at the least Denomi o nation, faying 2 from 1 I cannor, therefore I borrow p one Penny from the next Denomination, and turn it into Farthings, which d. grato is 4, and adding 4 to I, which is 5, 375 13 07 I fay, but 2 from 5, and there remain 57 16 03 2. which I put under the Line; then going on, I fay, I that I borrow'd and 3 is 4 317 03 17 from 7, and there reffs 3; then going

on, I say, 16 from 13 I cannot, but borrowing 1 Pount in and turning it into 20 Shillings, I add to it 13, and that it (33) wherefore I say, 16 from 33 and there remains 175 which I set under the Line, and go on; saying 1 that whorrowed and 7 is 8, from 5 I cannot, but 8 from 1 sur and there remain 7; and the 1 that I borrowed and 5 is I from 7 there rests 1, and 5 from 3 rests 3, and the World is done. And I find the Remainder or Difference to but

217 l. 17 s. 2 d. 3 grs.

Another Example of Troy-weight, may be this. would fubrract 17 1. 10 07 . 11 p. w. 20 gr. from 24 tut 5 07. 00 p. w 08 gr. I place the Numbers according to the Rule, and 1. oz. p.w. begin, faying, 20 from 8 I cannor, 24 05 00 but I horrow I Penny-weight, which is 17 10 11 24 Grains and add them to 8, and there are 32, wherefore I say 20 from 06 06 08 32 refts 12; then I that I borrowed

and 11 is 12, from co I cannot, but 12 from 20 (borres ing an Ounce, which is 20 Penny-weight) and there is main 8, then I that I borrowed and 10 is 11, from 51 cannot, but II from 17, and there refts 6; then I that borrowed, and 7 is 8, from 4 I cannor, but 8 from 1

8. When your Subtraction is ended, if you defire to prove the Work, whether it be true or no; then add the Remainder to the minor Number, and if the Aggregate of these two be equal to the major Number, then is your Operation true, otherwise false: Thus let us prove the first Example of the fifth Rule of this Chapter, where after Subtraction is ended, the Numbers stand as in the Margent, the

Quest. 2. A Gentleman hath owed a Merchant 365 l. whereof he hath paid 278 l. What more doth he owe?

Rule of the fame, I fubtract the Minor from the

Major, and the Remainder, Excess, or Difference I find to be 50. See the Work in the Margent.

To give an Answer to this Question, I first set down the major Number 365 L and under it I place 365 278 the minor, and subtract the one from the other, 278 whereby I discover the Excess, Difference, or Remainder, to be 87; and fo much is fill due to the 87

Creditor, as per Margent.

Queft. 3. An Obligation was written, a Book printed, a. Child born, a Church built, or any other Thing made in the Year of our Lord 1572, and now we account the Year of our Lord 1687, the Question is to know the Age of the faid Things; that is, How many Years are passed fince the faid Things were made? I fay, if you subtract the lesser Num-115 ber 1572, from the greater 1687, the Remainder will be 115, and so many Years are passed since the Making of the faid Things; as by the Work in the Margent.

Queft. 4. There are three Towns lie in a ftraight Line, viz. London, Huntingdon, and York, now the Distance between the farthest of these Towns, viz. London and Tork, is 151 Miles, and from London to Huntingdon is 49 Miles. I demand how far it is from Huntingdon to Tork?

To resolve this Question, subtract 49 the Distance between London and Huntingdon, from 151, the Distance between London and Tork, and the Remainder is 102 for the true Distance between Huntingdon and

York. See the Work in the Margent.

CHAP. VI.

Of Multiplication of Whole Numbers.

A Ultiplication is performed by two Numbers of like Kind for the Production of a Third, which sha'l have such Reason to the one, as the other hath to the Unir, and in Effect is a most brief and artificial Compound! Addition of many equal Numbers of like Kind into one Sum. Or, Multiplication is that by which we multiply two or more Numbers, the one into the other, to the End that their Product may come forth, or be discovered.

C. 4:

Ora,

by any other, so often as there are Units in that Number, by which the other is increased; or by having two Numbers given to find a third, which shall contain one of the Numbers as many times as there are Units in the other

2. Multiplication hath three Parts. First, The Multiplicand or Number to be multiplied. Secondly, The Multiplier or Number given by which the Multiplicand is to be multiplied. And thirdly, The Product or Number produced by the other two, the one being multiplied 8 by the other; as if 8 were given to be multiplied by 4. I say 4 times 8 is 32; here 8 is the Multiplicand, and 4 is the Multiplier. and 32 is the Pro- 32 duct.

3. Multiplication is either Single, by one Figure; or

m

t

in

W

tij

pl

fic

lo

P

di

m

C

E

ar

fr

w

Compound, that confifts of many.

32

Single Mu'tiplication is said to consist of one Figure, because the Multiplicand and Multiplier consist each of them of a Digic, and no more; so that the greatest Product that can arise by Single Multiplication is 81, being the Square of 9; and Compound Multiplication is said to consist of many Figures, because the Multiplicand or Multiplier consists of more Places than one; as if I were to multiply 436 by 6: It is called Compound, because the Multiplicand 436 is of more Places than one, viz. 3 Places.

4. The Learner ought to have all the Varieties of Single Multiplication by Heart, before he can well proceed any farther in this Art, it being of most excellent Use, and none of the following Rules in Arithmetick, but what have a principal Dependance thereupon, which may be learn

by the following Table.

alti-Inj-

wie

fı

9;

Fi-

of

6: 5 is

igle ced

TO

Multiplication TABLE.

1.	2	1 3	4	5	6	17	8	9
2	4	6	8	10	12	14	16	18
3	6	9	12	15	18	21	24	27
4	8	12	16	20	24		32	36
5	10	15	20	25	30	35	40	45
6.	12	18	24	30	36		48	54
7	14	21	28		42	49	56	63
8	16	24	32	40	48	56	64	72
9	18	27	36	45	54	63	72	81

The Use of the precedent Table is this: In the uppermost Line or Column you have expressed all the Digits from to 9; and likewise beginning at t and going downwards in the fide Column, you have the fame: fo that if you would know the Product of any two fingle Numbers multiplied by one another, look for one of them (which you please) in the uppermost Column, and for the other in the fide Column, and running your Eye from each Figure along the respective Columns in the common Angle for Place) where these two Columns meet, there is the Product required. As for Example, I would know how much is 8 times 7; First I look for 8 in the uppermost Column, and 7 in the fide Column; then do I cast my Eye from 8 along the Column downwards from the fame. and likewise from 7 in the side Column, I cast my Eye from thence toward the right Hand, and find it to meet with the first Column at 56, so that I conclude 56 to be the Product required, coc.

5. In Compound Multiplication, if the Multiplicand confifts of many Places, and the Multiplier of bur one Figure; first ser down the Multiplicand, and under it place the Multiplier in the Place of Units, and draw a Line underneast them; begin then and multiply the Multiplier into every particular Figure of the Multiplicand, beginning at the Place of Units, and so proceed towards the less Hand, sening each particular Product under the Line, in order as you proceed: But if any of the Products ex-

ceeds 10, or any Number of Tens, fet down the Excel and for every 10 carry an Unit to he added to the next Pro duct, always remembring to fet down the total Product of the last Figure; which Work being finished, the Sum of Number placed under the Line shall be the true and ton Product required As for Example, I would multiply 478 by 6: First fee down 478, and underneath it 6, in th Place of Units, and draw a Line underneath them, as in the Margent; then I begin, saying, 6 times 8 is 48, which is 8 above four Tens, therefore I fet down 8 (the Excess) and bear 4 in Mind for the 4 Tens; then I proceed, faying, 6 times 7 is 42, and that I carried is 46, I then fet down 6 and carry 4, and go on, faying, 6 times 4 is 24, and 4 that I carried in 28, and because it is the last Figure, I fer it all down, and fo the Work is finished, and the Product is found to be 2868, as was required.

6. When in Compound Multiplication, the Multiplier confisters of divers Places, then begin with the Figure in the Place of Units in the Multiplier, and multiply it into all the Figures in the Multiplicand, placing the Product below the Line, as was directed in the left Example; then begin with the Figure of the second Place of the Multiplier, viz. the Place of Tens, and multiply it likewise into the whole Multiplicand, (as you did the first Figure) placing its Product under the Product of the first Figure; do in the same Manner by the Third, Fourth, and Fifth, Grantil you have multiplied all the Figures of the Multiplier particularly into the whole Multiplicand, still placing the Product of each particular Figure under the Product of its precedent Figure; herein observing the following

Caution.

In the placing of the Product of each par- A Caution. ticular Figure of the Multiplier, you are not to follow the 2d Rule of the 4th Chapter, viz. to place Units under Units, and Tens under Tens, &c. but to place the Figure or Cypher in the Place of Units of the fecond Line under the fecond Figure or Place of Tens in the Line above it, and the Figure or Cypher in the Place of Units in the third Line under the Place of Tens in the fecond Line, &c. observing this Order, till

ace.

of

of

in

of

till

you have finished the Work, still placing the first Figure of every Line or Product under the second Figure or Place of Tens in that which was above it, and having so done, draw a Line under all these particular Products, and add them together; so shall the Sum of all these Products be the total Product required.

As it is were required to multiply 764 by 27, I fet 'em down the one under the other, with a Line drawn underneith them; then I begin, faying, 7 times 4 is 28, then

I fer down 8 and carry 2; then I fay, 7 times
6 is 42, and 2 that I carried is 44, that is 4 and go
4; then 7 times 7 is 49, and 4 that I carry is
53, which I fer down, because I have not another Figure to multiply; thus I have done with
53:8
the 7, then I begin with the 2, saying 2 times 4
is 8, which I set down under (4) the second Figure or Place of Tens in the Line above it, as you
20528
may see in the Margent; then I proceed, saying,

2 times 6 is 12, that is 2 and carry 1; then 2 times 7 is 14, and 1 that I carry is 15, which I fet down, because 'tis the Product of the last Figure; so that the Product of 764 by 7 is 5348, and by 2 is 1528, which being placed the one under the other, as before directed, as you see in the Margent, and a Line drawn under them, and they added together respectively, make 20628, the true Product re-

quired, being equal to 27 times 761.

Another Example may be this; Let it be required to multiply 5486 by 455, I dispose of the Multiplicand and

Multiplier according to the Rule, and begin multiplying the first Figure of the Multiplier, 5486 which is (5) into the whole Multiplicand, 465 and find the Product is 27430; then I proceed, and multiply the fecond Figure (6) of the 27430 Multiplier into the Multiplicand, and find the 2916 Product to amount 32916, which is subscri-21944 bed under the other Product respectively; then do I multiply the third and last Figure 2550990 (4) of the Multiplier into the Multiplicand, and the Product is 21944, which is likewise

placed under the second Line respectively; then I draw a Line under the said Products being placed the one under the

(

4

D

2

fi

ME

Ь

(

(

t

the other according to Rule) and add them together and the Sum is 25,50990, the true Product fought, being equal to 5486 times 465, or 465 times 5486.

Mre Examples in t 430965 4739	bis Rule are thefe following. 6400758 37496
3877785 12,2595 3016055 1723460	39404548 / 57606822 25603032 44805306
2041869235	240002821968

Compendium in Multiplication.

7. Although the former Rules are sufficient for all Cases in Multiplication, yet because in the Work of Multiplication many times great Labour may be saved, I shall acquaint the Learner with some Compendiums in order thereto, viz. If the Multiplicand or Multiplier, or both of them, end with Cyphers then in your mul-

Si numeris propsitis unus vel uterque adjunctes babeat ad dextram circules, omissis circulis siat ipserum numerorum multiplicatio, I facto demum tot insuper integrorum loci accenseantur quet sunt omissi circuli in utreque factore. Clavis Mat. c. 4. 3.

tiplying you may neglect the Cyphers, and multiply only the fignificant Figures, and to the Product of those fignificant Figures, and to the Product of those fignificant Figures, add so many Cyphers as the Numbers given to be multiplied did end with; that is, annex them on the right Hand of the said \$2000 Product, so shall that give you the true Pro-

Product, so shall that give you the true Product required. As if I were to multiply 32000 by 4300, I set them down in order to be multiplied, as you see in the Margent; but neglecting the Cyphers in both Numbers, I only multiply 32 by 43, and the Product I find to be 1376, to which I an-

137600000

96

128

nex the 5 Cyphers in the Multiplicand and Multiplier,

and

and then it makes 137600000 for the true Product of 30000 by 4300.

8. If in the Multiplier, Cyphers are placed between fignificant Figures, then multiply only by the fignificant Figures neglecting the Cyphers; but here special Notice is to be taken of the

Si intermedio multiplicantis loco circulus fuerit, ille negli gitur. Alfted. c.6. De Arithm.

true placing of the first Fi-

gure after the Neglect of fuch Cypher or Cyphers; and therefore you must observe in what Place of the Multiplier the Figure you multiply by standeth, and fet the first

Figure of that Product under the fame Place of the Product of the first Figure of your Multiplier: As for Example, L.t it be required to multiply 371568 by 40007. First I multiply the Multiplicand by 7, and the Product is 2600976; then neglecting the Cyphers, I multiply by 4, and that Product is 1486272; now I con-

2600976 1486272 14855320776

371561

40007

fider, that 4 is the 5th Figure in the

Multiplier, therefore I place 2 (the first Figure of the Product by 4) under the fifth Place of the first Produce by 7, and the rest in order, and having added them together, the total Product is found to be 1486;330976. Other Examples in this Rule, are these tollowing:

6030 9827580 1965516.

1975343516

327596

7864371 20601

31457484 47186226

162037500084

15728712

9. If you are to multiply any Number by an Unit with Cyphers, as by 10, 100, 1000, &c. then annex so many Cyphers before the Multiplicand, and that Number when would multiply 428 by 100, annex 2 Cyphers to 428, and it is 42800. If it were required to multiply 102 by

10000

0-

IM

3

tur

in

at.

DIY . ofe

ers

CO

ICT. and

I

b

10000, annex 4 Cyphers, and it gives 1020000 for the Product required.

The Proof of Multiplication.

Truth, all other Ways are false, (according to Frisius) and therefore it will be necessary in the first Place to learn Division, and by that to prove Multiplication. There are some other Ways used indeed, but on a strict Examen, there is not one in a Thousand of their Products right; therefore we omit them.

11. The general Effect of Multiplication is contained in the Definition of the same, which is to find out a third Number, so often containing one of the two given Num-

bers, as the other containeth Units.

The second Effect is, by having the Length and Breadth of any Thing (as a Parallelogram or long Plain) to find the superficial Content of the same, and by having the superficial Content of the Base, and the Length, to find out the Solidity of any Farallelopipedon, Cylinder, or other solid Figures.

The third Effect is, by the Contents, Frice, Value, Buying, Selling, Expence, Wages, Exchange, Simple Intereft, Gain or Loss of any one thing, be it Money, Merchand ze, Ore to find out the Value, Price, Expence, Buying, Selling. Exchange, or Interest of any Number of

Things of like Name, Nature, and Kind.

The fourth Effect (is not much unlike the other) by the Contents, Value, or Price of any one Part of any Thing denominated, to find the Contents, Value, or Price of the whole thing, all the Parts into which the whole is divided, multiplying the Price of one of those Parts.

The fich Effect is, to aid, to compound, and to make other Rules, as chiefly, the Rule of Proportion, called the Golden Rule, or Rule of Three; also by it, Things of one

Denomination are reduced to another.

If you multiply any Number of Integers, or the Price of the Integer, the Product will discover the Price of the

Quantity, or Number of Integers given.

In a Rectangular Solid, if you multiply the Breadth of the Base by the Depth, and that Produce by the Length the last Product will discover the Solidity or Content of the same Solid. Some Questions proper to this Rule, may be these following:
Quest. 1 What is the Content of a square Piece of
Ground, whose Length is 28 Perches, and Breadth 13?

Answer, 364 square Perches; for mul iplying 28 the

Length, by 13 the Breadth, the Product is fo much.

Quest. 2. There is a square Battle, whose Flank is 47 Men, and the Files 19 deep, what Number of Men doth that Battle contain? Facit 893; for multiplying 47 by 19, the Product is 893.

Quest. 3. If any one Thing cost 4 Shillings, what shall 9 Things cost? Answ. 36 Shillings; for multiplying 4 by

9, the Product is 36.

tent

Quest. 4. If a Piece of Money or Merchandize be worth, or cost 17 Shillings, what shall 19 such Pieces of Money or Merchandize cost? Facit. 323 Shillings, which is equal to 16 l. 3 s.

Quest. 5. If a Soldier or Servant get or spend 14 s per Month, what is the Wages or Charges of 49 Soldiers or Servants for the same Time? Multiply 49 by 14, the

Product is 686's. or 141.6 s. for the answer.

Quest. 6. If in a Day there are 24 Hou, how many Hours are there in a Year, accounting 365 Days to constitute the Year? Facit. 8760 Hours; to which if you add the 6 Hours over and above 365 Days, as there is in a Year, then it will be 8766 Hours; now if you multiply this 8766 by 60, the Number of Minutes in an Hour, it will produce 525960, the Number of Minutes in a Year.

CHAP. VII.

Division of whole Numbers.

Division, is the separating or parting of any Number or Quantity given, into any Parts assigned, or to find how often one Number is contained in another; or from any two Numbers given, to find a third that shall consist of so many Units, as the one of those two Numbers given is comprehended or contained in the other.

2. Division hath three Parts or Numbers remarkable, viz. First, The Dividend; 2dly, The Divisor; 3dly,

ti

The Quotient. The Dividend is the Number given to be parted or divided. The Divisor is the Number given by which the Dividend is divided, or it is the Number which sneweth how many Parts the Dividend is to be divided into. And the Quotient is the Number produced by the Division of the two given Numbers the one by the other.

So 12 being given to be divided by 3, or into three equal Parts, the Quotient will be 4; for 3 is contained in 12 four times, where 12 is the Dividerd, and 3 is the Di-

visor, and 4 is the Quotient.

3. In Division set down your Dividend, and draw a crooked Line at each End of it, and before the Line at the left Hand place the Divitor, and behind that on the right Hand place the Figures of the Quotient, as in the Margent, where it is required to divide 12 3) 12 (4 by 3: First, I set down 12 the Dividend, and on each Side of it, do I draw a crooked Line, and before that on the left Hand do I place 3 the Divisor; then do I seek how often 3 is contained in 12; and because I find

it four times, I put 4 behind the crooked Line, on the right Hand of the Dividend, denoting the Quotient.

4. But if, when the Divisor is a fingle Figure, the Dividend confifteth of two or more Places, then baving placed them for the Work (as before directed) but a Point under the first Figure of the lest Hand of the Dividend, provided it be bigger than (or equal to) the Divisor; but if it be leffer than the Divisor, then put a Point under the fecond Figure from the left Hand of the Dividend; which Figures, as far as the Point goeth from the left Hand, are to be reckon'd by themselves, as if they had no Dependance upon the other Part of the Dividend: And for Diffinction Take may be called the Dividual; then ask how often the Divisor is contained in the Dividual; placing the Answer in the Quotient; then multiply the Divisor by the Figure that you placed in the Quotient, and fer the Product thereof under your Dividual; then draw a Line under the Product, and subtract the said Product from the Dividual, placing the Remainder under the faid Line; then put a Point under the next Figure in the Dividend on the right Hand of that to which you put the Point before, and

draw

draw it down, placing it on the right Hand of the Remainder which you found by Subtraction; which Remainder, with the faid Figure annexed before it, shall be a new Dividual; then see again how often the Divisor is contained in this new Dividual, and put the Answer in the Quotient on the right Hand of the Figure which you put there before; then multiply the Divifor by the last Figure that you put in the Quotient, and subscribe the Product under the Dividual, and make Subtraction, and to the Remainder draw down the next Figure from the grand Dividend, (having first put a Point under it) and put it on the right Hand of the Remainder for a new Dividual as before, and proceed thus till the Work is finished.

Observing this general Rule in all Kinds of Division. First, to seek how often the Divisor is contained in the Dividual; then (having put the Answer in the Quotient) multiply the Divisor thereby, and subtract the Product from the Dividual. An Example or two will make the Rule plain. Let it be required to divide 2184 by 6. I dispose of the Numbers given as is before directed, and as

you fee in the Margent; in order to the

Work, then because 6 the Divisor is more 6) 2184 (3 than 2 the first Figure of the Dividend) I

put a Point under 1 the second Figure, which makes the 21 for the Dividual, then do I ask how often 6 the Divisor is contained in 21, and because I can-

not have is more than 3 times, I put 3 in the Quotient, and thereby do I multiply 6) 2184 (3) the Divisor (6) and the Product is 18, which I fer in order under the Dividual, and subtract it therefrom, and the Remainder (3) I place in order under the Line) as you see in the Margent.

Then do I make a Point under the next Figure of the Dividend, being 8, and draw it down, placing it before the Remainder 3, so have I 38 for a new Dividual, then do I feek how often 6 is contained in 38, and because I can't have it more than 6 Times, I put 6 in the Quotienr, and thereby do I multiply the Divisor 6, and the

3

th

Re

an

fo

Product (36) I put under the Dividual (38) and subrait therefrom, and the Remainder 2 I put under the Line

as you fee in the Margent.

Then do I put a Point under the next (and laft) Figu of the Dividend (being 4) and draw it down to the Re maindar 2, and putting it on the eight Hand thereof, i maketh 24 for a new Dividual; then I ask how often 6 is contained in 24, and 6) 2184 (364 the Answer is 4. which I put in the Quotient, and multiply the Divisor (6) 18 thereby, and the Product (24) I put under the Dividual (24) and fubtract it 38 36 therefrom and the Remainder is (0); and thus the Work is finished, and I find the Quotient to be 364, that is 6 is con-24 tained in 2184, juft 364 times, or 2184 24 being divided into 6 equal Parts, 364 is one of those Parts. (o)

Again, If it were required to divide 2646 by 7, or im 7 equal Parts, the Quotient will be found to be 378, a by the following Operation appeareth.

7) 2646 (378

So if it be required to divide 946 by 8, the Quotien will be found to be 118, and 2 remaining after Division i ended. The Work followeth:

364

otic

(2)

Many times the Dividend cannot exactly be divided by the Divisor, but something will remain, as in the last Example, where 946 was given to be divided by 6, the Quotient was 118, and there remained 2 after the Division was ended: Now what is to be done in this Case with the Remainder, the Learner shall be taught when we come to treat of the Reducing (or Reduction) of Fractions.

And here note, That if after your Division is ended, any Thing do remain, it must be lesser than your Divisor;

for otherwife your Work is not rightly performed.

Other Examples are such as foliow.

8) 73464 (9183	9) 13758 (1528
72	9

226

216

So if you would divide 9464 by 24, the Quotient wil be found to be 394; I first put down the given Numbers is before directed in the 3d Rule. Now because my Divisor confisteth of two Figures, I there-

fore put a Point under the second Figure from the left Hand of my Dividend, which there is 4, wherefore I feek how often 2 the first Figure (on the left Side of the Divisor) is contained in 9 (the like first in the Dividual) the Answer is 4, which I put in the Quotient, and thereby multiply all the Divisor, and find the Product to be 96, which is greater

cincin ci

in in the city of
rem

than the Dividual 94, wherefore I cancel the 4 in the Quotient, and instead thereof I put 3, (an Unit leffer) and by it multiply the Divisor 24, and the Product is 72, which I subtract from 94 the Dividual, and the Remainder is 22; then do I make a Point under the next Figure 6 in the Dividend, and draw it down, and place it on the right Side of the Remainder 22, and it makes 226 for a new Dividual; now because the Dividual 226 confifteth of a rigure more than the Divifor, therefore I feek how often 2 (the Ift Figure of the Divisor) is contained in 22, the two first of the Dividual, and I fay 9 times, wherefore I put 9 in the Quotient, and thereby multiply the Divisor

24, the Product (216) I place under the Dividual 226,

and subtract it from ir, and there remaineth 10.

Then I go on and make a Point under the next and laft Figure (4) in the Dividend, and draw it down to the Remainder 10, and it makes 104 for a new Dividual, which is also a Figure more than the Divisor; and therefore I feek how often 2 is contained in 10, I answer 5 times; but multiplying my Divisor by '5, the Product is 120, which is greater than the Dividual, and therefore I make it but 4, and by it multiply the Divisor, and the Product is 96, which being placed under, and subtracted from the Dividual, there remaineth 8; and thus the whole Work of this Division is ended, and I find that 9464, being divided by 24, or into 24 equal Parts, is found to be 394, as was said before; and the Remainder is 8, as you see in the Work following.

24) 9464 (394

two first of the Dividual, and I fay,	170	-
there is 9 times 3 in 28; but mul-		
ciplying my whole Divisor (385)	thereby, I mid in	1
Product to be 3465, which is great	iter than the Dividu	1
2865; wherefore I chuse 8, which	1 is letter by an Up	4
than 9, and thereby I multiply my	Divitor 385, and the	1
Productiis 3080, which still is greate	et than the laid hand	
	a	7

al; wherefore I chuse another Number yet an Unit lesser, viz 7, and have multiplied my Divisor thereby, the Product is 2695, which is lesser than the Dividual 2865, wherefore I put 7 in the Quotient and subtract 2695 from the Dividual 2865, and there remain 170; then I draw down the last Figure (3) in the Dividend, and place it before the said Remainder 170, and it makes 1703 for a new Dividual; then (for the Rea-

fon abovefaid) I feek how often 3 is contained in 17 the Answer is 5, but multiplying the Divisor thereby, the Product is 1925, greater than the Dividual, wherefore I say it will bear 4 (an Unit

ich

389

the idual Unit of the vidu

al;

Di

fore I fay it will bear 4 (an Unit leffer) and by it I multiply the Divisor 385. and the Product is 1540, which is leffer than the Dividual, and therefore I put 4 in the Quotient, and subtract the

faid Product from the Dividual,

for and there remain 163; and thus the Work is finished; and there I find that 1183653 being divided by 385, or into 385 ng requal Shares or Parts, the Quotient, (or one of those Parts)

I do is 3074, and befides there is 163 remaining.

And thus the Learner being well vers'd in the Method down of the foregoing Examples, he may be sufficiently qualified for the dividing of any greater Sum or Number into as many Parts as he pleaseth, that is, he may understand the Method of dividing by a Divisor, which consisteth of 4, or 5, or 6, or any greater Number of Places, the Method being the same with the foregoing Example in every Respect.

many Figures from the right Hand of the Dividend, as there are Cyphers before the Divisor, and let the remaining Numbers in the Dividend, he divided by the remaining Number, or Numbers of the Divisor, observing this Caution: That if after your Division is ended, any Thing remain, you are to annex thereto the Number or Numbers that were cut off from the Dividend; and fuch new found Number shall be the Remainder. (See Mr. Oughtred's Clavis Mathematica, cap. 5. 3.) As for Example, Let it

be required to divide 46658 by 400, now because there are two Cyphers before the Divisor, I cut off as many Figures from before the Dividend, viz. 58, fo that then there will remain only 466 to be divided by 4, and the Quotient will be 116, and there will remain 2, to which I annex the two Figures (58) which were cut off from the Dividend, and it makes 258 from the true Remainder; fo that I conclude 46658 being di-

(258)

vided by 400, the Quotient will be 116, and 258 remain after the Work is ended; as by the Work in the Margent.

ter d

04

aind

2. And hence it followeth, that if the Divisor be I, or an Unit with Cyphers annexed, you may cut off fo many Figures from before the Dividend, as there are Cyphers in the Divisor, and then the Figure or Figures that are on the left Hand will be the Quotient, and those that are on the right Hand will be the Remainder after the Division is ended. (Vid. Gem. Frif. Arith. Par. 1.) As thus; if 45783 were to be divided by 10, I cut off the laft Figure (3) with a Dash thus, 4578 2, and the Work is done, and the Quotient is 4578 (the Number on the left Hand of the Dafh) and the Remainder is 3 (on the right Hand.) In like manner if the same Number 45783 were to be divided by 100, I cut off two Figures from the End thus, (457/83) and the Quotient is 457, and the Remainder is 82. And if I am to divide the same Figures, by 1000, I cut off 3 from the End thus (45/783) and the Quotient is 45, and 783 is the Remainder, &c. 6. The 6. The general Effect of Division, is contained in a Definition of the same, that is, by having two unequal Numbers, to find a third Number in such Proportion to the Dividend, as the Divisor hath to Unit or 1: It also discovers what Reason or Proportion there is between Numbers so if you divide 12 by 4, it quotes 3, which shews the Reason or Proportion of 4 to 12 is triple.

The fecond Effect is, by the superficial Measure or Content, and the Length of any Oblong, Rectangular Parallelogram, or square Plane known, to find out the Breadt thereby; or contrarywise, by having the Superficies and Breadth of the said Figure, to find out the Length thereof. Also by having the Solidity and Length of a Solid, to find

the Superficies of the Bafe, to contra.

The third Effect is, by the Contents, Reason, Price, Value, Buying, Selling, Expences, Wages, Exchange, Interest Profit, or Loss of any Number of Things (be it Money, Merchandize, or what else) to find out the Contents, Reason, Price, Value, Buying, Selling, Expence, Wages Exchange, Interest, Profit, of Loss, or any one Thing of the like Kind.

The fourth Effect is, to aid, to compole, and to make other Rules, but principally the Rule of Proportion, called the Golden Rule, or Rule of Three, and the Beduction of Monics, Weights, and Measures of one Denomination into another; by it also Fractions are abbreviated, by finding a common Measures unto the Numerator and Denominator, thereby discovering commensurable Numbers.

If you divide the Value of any certain Quantity by the same Quantity, the Quotient discovers the Rate or Value of the Integer; as if 8 Yards of Cloth cost 20 Shillings, it you divide (96) the Value of Price of the given Quantity, by (8) the same Quantity, the Quotient will be 128, which is the Price or Value of 1 of those Yards, Gre-

If you divide the Value or Price of any unknown Quantity, by the Value of the Integer, it gives you in the Quotient that unknown Quantity, whose Price is thus divided; as if 12 Shillings were the Value of a Yard, I would know how many Yard; are worth 96 Shillings: Here if you divide (96), the Price or Value of the unknown Quantity, by 12, the Rate of the Integer, or 1 Yard, the Quotient will be 8, which is the Number of Yards worth 96 s. Some Questions answered by Division may be these following.

Quest 1. If 22 Things cost 66 Shillings, what will 1 fuch Thing cost! Facit 3 Shillings, for if you divide 66 by 22, the Quotient is 3 for the Answer; fo if 26 Yards or Ells of any Thing be bought or fold for 108 1. how much will one Yard or Ell be bought or fold for? Facit 3 1. for if you divide 108 by 26 Yards, the Quotient will be 3 1. the Price of the Integer.

Quest. 2. If the Expence, Charges, or Wages of 7 Years, amount to 868 1. what is the Expence, Charges, or Wages of one Year? Facit 124 l. for if you divide 868 (the Wages of 7 Years) by 7 (the Numbers of Years) the Quotient will be 124 l. for the Answer. See the Work :

7) 868 (124

Quest. 3. If the Content of one superficial Foot be 144 Inches, and the Breadth of a Board be 9 Inches, how many Inches of that Board in Length will make fuch a Foot? Facit 16 Inches; for by dividing 144 (the Number of square Inches in a square Foot) by 9, (the Inches in the Breadth of the Board) the Quotient is 16 for the Number of Inches in Length of that Board to make a fuperficial Foot.

9) 144 (16 Inches

Quest. 4 If the Content of an Acre of Ground be 160 square Perches, and the Length of a Furlong (propounded) be 80 Perches, how many Perches will there go in Breadth to make an Acre: Facit 2 Perches; for if you divide 160, the Number of Perches in an Acre, by 80, (the Length of the Furlong in Perches) the Quotient is 2 Perches; and so many in Breadth of that Furlong will make an Acre.

80) 160 (2 Perches.

160

(0)

Quest. 5. If there be \$93 Men to be made up into a Battle, the Front confishing of 47 Men; what Number multiple be in the File? Facit, 19 deep in the File; for if you divide 893 (the Number of Men) by 47 the Number in the Front) the Quotient will be 19 in Depth of the File. The Work followeth.

47) 893 (19 Deep in File.

47 423 423

(0)

Quest. 6. There is a Table whose superficial Contents if 72 Feet, and the Breadth of it at the End is 3 Feet; now I demand what is the Length of this Table? 3) 72 (24 Facit 24 Feet long; for if you divide 72 (the Content of the Table in Feet) by 3 (the Breadth of it (the Quotient is 24 Feet for the Length thereof, which was required. See the Operation in the Margent.

The Proof of Multiplication and Division.

Multiplication and Division interchangeably prove each other; for if you would prove a Sum in Division, whe ther the Operation be right or no, multiply the Quotien

Whole Numbers 53 Chap. 7. by the Divisor; and if any Thing remain after Division is ended, add it to the Product, 7654 which Product (if your Sum was rightly di-3242 vided) will be equal to the Dividend. And contrariwife, if you would prove a Sum in 15308 Multiplication, divide the Product by the 30516 Multiplier, and if the Work was rightly per-15308 formed, the Quotient will be equal to the 22962 Multiplicand.' See the Example, where the Work is done and undone. Let 7654 be gi-24814268 ven to be mulriplied by 3242, the Product will be 24814268, as by the Work appeareth. And then if you divide the faid Product 24814268 by 2242 the Multiplier, the Quotient will be 7654, equal to

0.7

und

0)

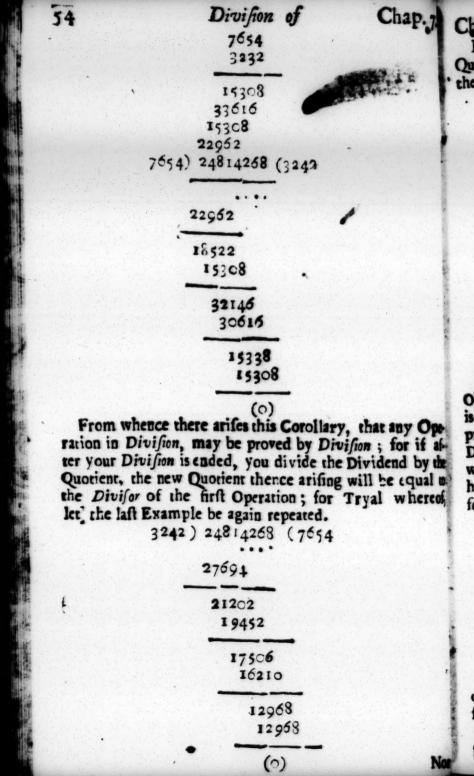

ories

the given Multiplicand.

In like Manner (to prove a Sum or Number in Division) if 24814268 were divided by 3242, the Quotient will be found to be 7654; then for Proof, if you multiply 7654 the Quotient, by 3242 the Divisor, the Product will amount to 24814268, equal to the Dividend.

(0)

Or you may prove the last, or any other Example in Multiplication, thus, viz. Divide the Product by the Multiplicand, and the Quotient will be equal to the Multiplier. See the Work.

2

the

l m

cof

Chap. 7. For Proof whereof divide again 24814268 by the Quotient 7654, and the Quotient hence will be equal to the Divison 3244 See the Work :

15308
(0)

But in proving Division by Division, the Learner is to Observe this following Caurion: That if after his Division is ended, there be any Remainder, before you go about to prove your Work, subtract the Remainder out of your Dividend, and then work, as in the following Example, where it is required to divide 43876 by 765, the Quotient here is 57, and the Remainder is 271. See the Work following.

Now to prove this Work, subtract the Remainder 271 out of the Dividend 43876, and there remaineth 43605, for a new Dividend to be divided by the former Quotient 57, and the Quotient thence arising is 765, equal to the given Divisor, which proverh the Operation to be right.

(271)

D 4

43876 271

57) 43605 (765

(0)

Thus have we gone through the four Species of Arithmetick, viz. Addition, Subtraction, Multiplication, and Division, upon which all the following Rules, and all other Operations whatsoever that are possible to be wrought by Numbers, have their immediate Dependance, and by then are resolved. (Vide Gem. Fris. Arith. Part 1.) Therefore before the Learner make a farther Step in this Art, let him be well acceptainted with what has been delivered in the foregoing Chapter.

CHAP. VIII.

Of Reduction.

Reduction is that which brings together two of more Numbers of different Denominations into one Denomination, [Hall's Arith. c. 13. p. 152.] or it ferveth to change or alter Numbers, Money, Weight, Measure of Time; from one Denomination to another; and likewife to abridge Fractions to the lowest Terms. All which it doth so precisely, that the first Proportion remaineth without the least Jot of Error or Wrong committed; so that it belongeth as well to the Fractions as Integer of which in the proper Place, Reductionis generally performed either by Mutiplication or Division; from whence we may gather, That,

2. Reduction is either Ascending or Descending.

. Reduction Descending, is when it is required to reduce a Sum or Number of a greater Denomination, into a Leffer; which Number, when it is fo reduced, shall be equal in Value to the Number first given in the greater Denomination; [Wing, Arith 7, 2, 3, 4.] as if it were required to know how many Shillings, Pence, or Farthings, are equal in Value to 100 L. Or how many Ounces are contained in 4500 Weight. Or how many Days, Hours, or Minutes, there are in 240 Years, &c. And this Kind of Reduction is generally performed by Mu'tiplication.

4. Reduction Ascending, is when it is required to reduce or bring a Sum or Number of a smaller Denomination into a greater, which shall be equivalent to the given Number; as suppose it were required to find out how many Pounds, Shillings, or Pence, are equal in Value to 4378; Farthings: Or, how many Hundreds are equal to (or in, 3748 Pounds, doc. and this Kind of Reduction is always performed by

Division.

5. When any Sum or Number is given to be reduced into another Denomination, you are to confider whether it ought to be refolved by the Ru'e Descending or Ascending, fre. by Multiplication or Division; if it be to be performed by Multiplication, confider how many Parts of the Denomination into which you would reduce it, are contain'd in an Unit or Integer of the given Number, and multiply the faid given Number thereby, and the Product there of will be the Answer to the Question. As if the Question were in 38 Pounds how many Shillings? Here I confider, that in one Pound are 20 Shillings, and that the Number of Shillings in 38 Pounds will be 20 times 38, 20 wherefore I multiply 38 1. by 20, and the Product is 7.60, and fo many Shillings are contained in 38 Pounds, as in the Margent.

But when there is a Denomination or Denominations between the Number given and the Number required, you miy (if you please) reduce it into the next interiour De. nomination, and then into the next lower than that, orc. until you have brought it into the Denomination required. As for Example, Let it be demanded in 132 Pounds, how many Farthings? First, I multiply 132 (the Number of Pounds given) by 20. to bring it into Shill age,

٦

be divided, or wrought by the Rule afcending, confider how many of the given Numbers are equal to an Unit, or Integer in that Denomination to which you would reduce your given Number, and make that your Divisor, and the given Number your Dividerd; and the Quotient thence are fing will be the Number fought or required : As for Example, let it be required to reduce 2640 Shillings into Pounds. Here I confider that 20 Shillings are equal to one Pound; wherefore I divide 2640 (the given Number) by 20, and the Quotient is 132, and fo many Founds are contained in 2540 Shillings. Reduction descending and ascerding, the Learner is advised to take p rticular Notice of the Tables del vered in the fecond Chapter of this Book, where he may be informed what Mulripliers and Divisors to make Use of in the reducing of any Number to any

other Denomination what foever, especially English Money, Weights, Measures, Time. and Motion; but in this Place? it is not convenient to meddle with Foreign Coins, Weight or Meafures.

But if in Reduction ascending, it happen that there is a Denomination or Denominations between the Number given and the Number required, then you may reduce your Number Reduction.

Numb r given into the next superiour Denomination, and when it is fo reduced bring it into the next above that. and fo on until you have brought it into the Denomination required. As for Example, Let it be demanded in 126720

Farthings how many Pounds? First I divide my given Number, being Parthings, by 4, to bring them into Pence. (because 4 Farthings make one Fenny) and there are 31680 Pence; then I divide 31680 Pence by 12, and the Quotient

giverh 2640 Shillings, and then I divide 2640 Shillings by 20. and the Quorient giverh 132 Pounds, which are equal in Value to 126720 Farthings: See the whole Work as it

followeth.

12) 210) (31680 (26410 (132 4) 126720

12	24	2

bes

until you have brought the Number given into the Demination propos'd. As if it were requir'd to reduce 18 13 5. 10 d. into Pence; first I bring 48 l. into Shilling by multiplying it by 20, and the Product is 960 Shilling to which I add the 13 Shillings, and they make 973; the I multiply 973 by 12, to bring the Shillings into Pencand they make 11676 Pence, to which I add the 101 and they make 11686 Pence for the Answer. See the Work done.

8. If in Reduction Ascending, after Livision is endoany Thing remain, such Remainder is of the same Deamination with the Dividend.

Example. In 4783 Farthings, I demand how man

First, I divide the given Number of Farthings, with (4783) by 4, to bring them into Pence, and the Quoin is 1195, and there remainesh 3 after the Work of Division is ended, which is 3 Farthings.

Again, I divide 1195 Pence (the faid Quetient) by it to reduce them into Shiilings, and the Quotient is 99 Shi lings, and there is a Remainder of 7, which is 7 Pence.

And then I divide 99 Shillings (the last Quotient) be 20, to bring it into Pounds, and the Quotient is 4 l. at there remaineth 19 Shillings; so that I conclude that it 4783 (the proposed Number of Farthings) there is Pounds, 10 Shillings, 7 Pence, 3 Farthings: View to following Operation;

934

467 Poun.

Or this Question might have been thus resolved, viz, multiply 5673 the given Number of the Pounds) by 960 (the Number of Farthings in a Pound) and it produceth the same Effect, as you may see by the Work.

5673 Pounds	20 Shilli
960	12
340380	240 Tence
1057	4

Facit 5446080 Farthings

960 Farthings

Otherwise thus: First bring the given Number 5673 1. into Shillings, and multiply the Shillings by 48 the Number of Farthings in a Shilling, and the same Effect is thereby likewise produced, viz.

5673 Pounds 20	12 Pence
113460 Shillings 48	48 Farthings.
907680 453840	

Fa. 5446080 Farthings.

form the Judgment of the Learner, with the Reason of the Rule. More Ways may be shewn, but these are sufficient even for the meanest Capacities.

Quest. 4. In 458 1. 16 s. 7 d. 3 qrs. how many Farthings? To resolve this Question, consider the 7th Rule of this Chapter, and work as you are there directed, and you find the aforesaid given Numbers to amount to 410479 Farthings, viz.

Sum 440479 Farthings.

440476 Farthings.

This last Question, or any other of this kind, may be more concifely refolved thus, viz. When you multiply the Pounds by 20, to bring them into Shillings, to the Product of the first Figure, add the Figure standing in the Place of Units in the Denomination of Shillings; but because the first Figure in the Multiplier is (0) I say, o times 8 is nothing, but 6 is 6, which I put down for the first Figure in the Product, then because the Multiplier is o, I go on no further with it; for if I should, the whole Product would be o, but proceed; and when I come to multiply by the second Figure in the Multiplier, to the Product of it, I add the Figure standing in the Place of Tens in the Denominations of Shillings, which is 1, faying, 2 times 8 is 16, and (the faid Figure) 1 is 17; then I fet down 7, and carry the Unit to the Product of the next Figure, as is directed in the 5th Rule of the 6th Chapter foregoing, and finish the Work. So that now you may have the whole Produ&

the

the

l. m-

of f-

9

of

Product and Sum of Shillings at one Operation, which's the same as before; and when you multiply the Shilling by 12, to bring them into Pence, (after the same Manner) add to the Product the Number standing in the Denomination of Pence, and to when you multiply the Pence by 4 to bring them into Farthings, add to the Product the Number standing under the Denomination of Farthings. See the last Question thus wrought.

Facit 440479 Farthings.

After the Method last prescribed, are all the following Examples, that are of the same Nature, wrought and resolved.

Queft. 5. In 4375866 Farthings, I demind how many

Pound:, Shillings, Pence, and Farthings?

Number of Farthings by 4, and the Quotient is 1093966 Pence, and there remaineth 2 after the Direction is ended, which (by the 8 h Rule foregoing) is two Farthings; then I divide 1093966 Pence by 12, and the Quotient is 91163 Shillings, and there remaineth 10 after Division, which by the siid 8th Rule is so many Pence, viz. 10 d. then I divide 91163 Shillings by 20, and the Quotient 4558 l. and there remaineth 3 Shilling; so the Work is sinished, and I find that in 4375866 Farthings, here are 4558 l. 3 s. 10 d. 2 grs. See the Operation.

Chap. 8.	Reducti	on.

12)

Quest. 6. In 4386 1. I demand how many Groats? To refolve this Question, I reduce the given Number of Pounds into Shillings, and they are 87720 Shillings, now I consider that in a Shilling are 3 Groats, therefore I multiply the Shillings by 3, and it produceth 263160 Groats See the Work.

Facit 4558

4386 Pounds 20

87720 Shillings

Facit 263 160 Groats.

This Question might have been otherwise resolved thus, viz. corfidering that in a Pound (or 20 Shillings) there are three Times 20 Groats, which makes 60, by which I multiply the Number of Pounds given, and it produceth the same Effect at one Operation, as followeth.

4369

4386 Pounds.
60 Groats in 20 s.

Facit 263160 Groats 4386 1.

Quest. 7. In 43758 Three pences, I defire to know

how many Pounds?

To resolve this, and many such like Questions; First, I divide my given Number of Three-pences by 4, became 4 Three-pences are in a Shilling, and the Quotient i 10939 Shillings, and there remaineth 2 after Division i ended, which is two Three-pences (by the 8th Rule of the Chapter) which are equal in Value to 6 d, then I divide 10939 Shillings by 20, and the Quotient giveth 546 and 19 s. remains: So that I conclude in 43758 Piecese Three-pence per Piece, there are 546 l. 19 s. 6 d. as the Work appeareth:

4) 43758	(1093 9	1. (546	s. 19	d. 06
<u> </u>	10			
37 36	9 8			
15				
12	13 12			
38	19	shi llin g	s.	

(2) Three pences, or 6 d.

This Question might have been otherwise resolved the viz. First multiply the given Number of Three-pene 43758, by 3 the Number of Pence in Three-pence, a the Product (viz. 131274) is the Number of Pence equation to the given Number of Three-pences, which Numbers Pence may be brought into Pounds by dividing by 12, a by 20, and the Quotient you will find to be equal to the former Work, 546 l. 19 s, 6 d.

P.

koon

216

Quest. 11. In 4386 l. I demand how many Pieces of d. of 4 d. and of 2 d. of each an equal Number? That is fay, What Number of Six pences, Groats, and Two-ences will make 4386 l. and the Number of each equal? The Way to resolve Questions of this Nature, is to add to several Pieces, into which the given Number is to be sought into one Sum, and reduce the given Number into the same Denomination with their Sum, and to divide the id given Number (so reduced) by the said Sum, and to Quotient will give you the exact Number of each tece. And after the same Method will we proceed to solve the present Question, viz.

ce, l

13

4386 Pe 240 Pe	Reduction, ounds ence	6 d. 4 d. 1
175440 8772		Sum 12 d,
2) 1052640 (96	87720	
92 84		4.4
85 84	Facit 87720 Pie	eces of 6 4
24 24	•	
(0)		

So that I conclude by the Operation, that 87720 5 pences, and 87720 Groats, and 87720 Two-pences, just as much as (or equal to) 4386 l. or if you admit 5 s. to be thus divided, it is equal to 5 Six-pences. 5 Four-pences or Groats, and 5 Two-pences.

Another Question of the same Nature with the

Bur

be this following, viz.

Queft. 12. A Merchant is defirous to change 148 L. Pieces of 13 d. 1, of 12 d. of 9 d. and 6 d. of 4 d. and oth will have of each fort an equal Number of Pieces, I de

to know the Number?

Do as you were taught in the last Question, viz. add feveral Pieces together, and reduce the Sum into B Pence, then reduce the Sum to be charged, viz. 14 into the same Denomination, and divide the Greatt the Lesser, and in the Quotient you will find the And viz. 798 is the Number of each of the Pieces requ and 18 remaineth, which is 18 Half-pence by the 8th of this Chapter. See the Work as followeth:

Quest. 15. A Merchant sent to a Goldsmith 16 Ingors of Silver, each containing in Weight 21. 402. and ordered it to be made into Bowls of 21. 802. per Bowl, and Tankards of 11. 602. per Piece, and Salts of 1002. 10 p.w. per Salt, and Spoons of 102. 18 p.w. per Spoon, and of each an equal Number; I defire to know how many of each Sort he must make?

Facit 482 7 13 21

This Question is of the same Nature with the 11th and 12th Questions foregoing, and may be answered after the same Method, viz. First, add the Weight of the several Vessels, into which the Silver is to be made, into one Sum, and reduce to one Denomination, and they make 1248 Fenny-weights; then reduce the Weight of the Ingot into the same Denomination, viz. Penny-weights, and it makes 560 Penny weights, and multiply them by the Number of Ingots, viz. 16, and the Product will give you the Weight of the 16 Ingots viz. 8960; then divide the Product by the Weight of the Vessels, viz. 1248, and the Quotient giveth you the Answer to the Question, viz. 7, and 224 p. w. remaineth over and above.

E 2

Rem. (224 Penny-weight.

The Proof of the Work is as followeth, viz.

D.W. l. 07. p.m. oo per Bowl is Bowls of 08 18 06 00 per Tank. is Tank. of C6 1 CO 10 05 00 16 per Salt, is of Sales 0 10 06 16 IO per Spoon, is Spoons of o 18 OI OI 01 06 224 Penny-weight remaining 00 11 04 37 04 90

So that you fee the Sum of the Weight of each Veffel, together with the Remainder, is 37 l. 4 17. which is equal to the Weight of the 16 Irgots delivered. For if 37 l. 4 17. be reduc'd to Penny-weights, it makes \$960.

many will reach round the World, the whole by \$4386 2'1600 Miles; fo that if any Person were to go und, and go 15 Miles every Day, he would go the whole Cincumference in 1440 Days, which is 3 Years, 11 onths, and 15 Days.

Reduction of Time.

Quest 23. In 28 Years, 24 Weeks, 4 Days, 16 Hours, 30 Minutes, how many Minutes?

Tears Weeks Days Hours Minutes
28 24 4 16 30

60

142

1480 Weeks

7

10364 Days

24

41462

20729

248752 Hours

60

14925150 Minures

Note, That in resolving the last Question after the Method expressed, there is lost in every Year 30 Hours. For the Year consistent of 365 Days and 6 Hours; but by multiplying the Years by 52 Weeks, which is 364 Days, you lose I Day and 6 Hours every Year; wherefore to find an exact Answer, bring the odd Weeks, Days, and Hours into Hours, and then multiply the Years by the Number of Hours in the Year, viz. 8766, and to the Product add the Hours contained in the odd Time, and you have the exact Time in Hours, which bring into Minutes, as before. See the last Question thus resolved:

Cha

172 24
694 345
4144 Hours

14975520 Minutes in 28 Years, and 4144 Hours.

60

So you see that according to the Methods first used neglove this Question, the Hours contained in the given Time are 248752, but according to the last, best, or truest Method, they are 249592, which exceeds the former by 840 Hours.

But for most Occasions it will be sufficient to multiply the given Years by 365, and to the Product add the Day in the odd Time, if there be any, and then there will be only a Loss of fix Hours in every Year, which may be supplied by taking a fourth Part of the given Years, and adding it to the contained Days, and you have your Defire.

Queft. 24. In 438657540 Minutes, how many Years!

Quest. 25. I defire to know how many Hours and Minutes it is fince the Birth of our Saviour Jesus Christ, being

accounted 1722 Years?

703

01-

phy

)ayı be

fup ad-

e.

This Question is of the same Nature with the 24th foregoing, and after the same manner is resolved, viz. multiply the given Number of Years by 8766, the Product is 15095052 Hours; and that by 60, and the Product is 905703120 Minutes. See the Work.

41722 Years 8766 Hours in a Year

15095052 Hours in 1722 Years 60

955703120 Minutes in 1722 Years.

Mate

Note, That as Multiplication and Division do aterchanably prove each other, so Reduction Descending, prove each other by inverting the Question, as 13th and 14th, and I kewite the 16th and 17th Questions foregoing by Inversion, do interchangeably prove of other. The like may be performed for the Froof of an Question in Reduction whatsoever.

CHAP. IX.

Of Comparative Arithmetick; viz. The Relation of Numbers one to another.

1. Comparative Arithmetick, is that which is wrough by Numbers, as they are confidered to have Relation one to another, and this confifts either in Quantity or in Quality. Vide Boetius's Arith. Lib. 1. cap. 21.

2. Relation of Numbers in Quantity, is the Reference of Respect that the Numbers themselves have to one another, where the Terms or Numbers propounded are always two, the first called the Antecedent, and the other the Conse-

quent (See Wing Arithm.)

- 3. The Relation of Numbers in Quantity confifs in the Differences, or in the Rate or Reason that is sound be twist the Terms propounded, the Differences of two Numbers being the Remainder sound by Subtraction, (according to Alsted) but the Rate or Reason betwist two Numbers is the Quotient of the Antecedent divided by the Consequent, so 21 and 7 being given, the Difference betwist them will be sound to be 14, but the Rate or Reason that is betwist 21 and 7, will be sound to be triple Reason, for 21 divided by 7, quotes 3, the Reason or Rite.
- 4. The Relation of Numbers in Quality otherwife called Proportion) is the Reference or Respect that the Reason of Numbers have one unto another; therefore the Terms given ought to be more than two. Now the Proportion or Reason between Numbers relating one to another, is either Arithmetical or Geometrical.

3. Arithmetical Proportion is, when divers Numbers differ one from another by equal Reason, that is, have equal Differences.

SEO.

bers have So the Rank of Numbers, 3, 5, 7, 9, 11, 13, 15, 17, Her by equal Reason, viz. by 2, as you may prove.

Proportion, the Sum of the first and last Term being muliplied by half the Number of Terms, the Product is the total Sum of all the Terms.

Or, it you mulpriply the Number of the Terms by the half Sum of the first and last Terms, the Product is the

total Sum of all the Terms

So in the tormer Progression given, 3 and 17 is 20, which multiplied by 4, viz. Half the Number of Terms, the Product gives 80, the Sum of all the Terms; or multiply 8 (the Number of Terms) by 10 (half the Sum of the first and last Term, the Product give. 80, as before.

So also, 21, 18, 15, 12, 9, 6, 3, being given, the Sum of all the Terms will be found to be 84; for here the Number of Terms is 7, and the Sum of the first and last (viz. 21 and 3) is 24, half whereof (viz 12) multiplied by 4, produceth 84, the Sum of the Terms sought.

7. Three Numbers that differ by rithmetical Proportion, the Double of the Mean (or middle Number) is e-

qual to the Sum of the Extreams.

So 9, 12, and 15, being given, the Double of the Mean 12, (viz. 24) is equal to the Sum of the two Extreams 9 and 15.

8. Four Numbers that differ by Arithmetical Proportion (either continued or interrupted) the Sum of the two Means

is equal to the Sum of the two Extreams,

So 9, 12, 18, 21, being given, the Sum of 12 and 18, will be equal to the Sum of 9 and 21, viz. 30; also 6, 8, 14, 16, being given, the Sum of 8 and 14 is equal to the Sum of 6 and 16 aviz. 22, Grc. See Wingate's Arith. c. 35.

9 Geometrical Proportion (by some called Geometrical Progression) is when divers Numbers differ, according to

right Reason.

So 1, 2, 4, 8, 16, 32, 64, &c. differ by double Reafon; and 3, 9, 27, 81, 243, 729, differ by triple Reafon; 4, 16, 64, 256, &c. differ by quadruple Reason, &c. portion, it you multiply the last Term by the Corients any one of the Terms divided by another of the Terms which being less is next unto it, and having deducted, or subtracted the first Term out of that Product, divide the Remainder by a Number that is an Unit less than the said Quotient, the last Quote will be the Sum of all the Terms,

So 1, 2, 4, 8, 16, 32, 64, being given, first I take one of the Terms, viz. 8, and divide it by the Term which is less, and next to it (viz. by 4) and the Quotient is 2, by which multiply the last Term 64, and the Product is 128, from whence I subtract the first Term, (viz. 1) the Remainder is 127, which divided by the Quotient 2 made less by 1, viz. 1. the Quote is 127, for the Sum of all the given Terms, as by t Work in the Margent.

So if 4, 15, 64, 256, 1024. were given, the Sum of all the Terms will be found to be 1364.

For first, I divide 64, one of the Terms.

For first, I divide 64, one of the Terms, by the next leffer Term, and the Quotient is 4, by which I multiply the last Term 1024, and it produceth 4096; from whence I subtract the first Term 4, and the Remainder is 4092, which I divide by the Quote less by 1, viz. 3 and the Quote is 1364, for the total Sum

3) 4092 (364

16) 64 (4

4096

of all the Terms, as per Margent.

51. Three Geometrical Proportionals given, the Square of the Mean is equal to the Rectangle, or Product of the Extreams

So 8 16, 32, being given, the Square of the Mean, viz. 16, is 256, which is equal to the Product of the Extreams 8 and 32, for 8 Times 32 is equal to 256.

12 Of Four Geometrical proportionable Numbers giyen, the Product of the two Means is equal to the Pro-

duct of the two Extreams.

So 8, 16, 32, 64, being given, I fay, that the Product of the two Means, viz. 16 Times 32, which is 512, is equal to 8 times 64, the Product of the Extreams.

Alfo

Gap. 10. The Single Rule, &c.

87

Alforif 3, 9, 21, 63, we given, which are interrupted, 1 fay, ATimes 21 is equal to 3 Times 63, which is equal

From hence ariseth that precious Gem in Arithmetick, which for the Excellency thereof is called the Golden Rule, or Rule of Three.

CHAP. X.

The Single Rule of Three Direct.

THE Rule of Three (not undeservedly called the Golden Rule) is that by which we find out a fourth Number in Proportion unto three given Numbers, so as this fourth Number that is fought may bear the same Rate, Reason, and Proportion to the third (given) Number, as the second doth to the first, from whence it is called the Rule of Proportion.

2. Four Numbers are said to be proportional, when the first containeth, or is contained by the second, as often as the third containeth, or is contained by the fourth. Vide

Wingate's Arith. Chap. 8. Sect. 4.

f

re

he

iz.

ms

gi-

10-

ua

Mo

So these Numbers are said to be Proportionals, viz. 3, 6, 9, 18; for as often as the first Number is contained in the second, so often is the third contained in the fourth. viz. twice. Also 9, 3, 15, 5, are said to be Proportionals; for as often as the first Number containeth the second. so often the third Number containeth the fourth, viz. 3 Times.

3. The Rule of Three is either Simple or Compound.

4. The Simple (or Single) Rule of Three, confifteth of 4 Numbers, that is to fay, it hath 3 Numbers given to find out a Fourth, and this is either Direct or Inverse. Vide Alstead Math. lib. 2. c. 13.

5. The Single Rule of Three Direct, is when the Proportion of the first Term is to the second, as the third is to the fourth, or when it is required that the Number fought, (viz.) the fourth Number must have the same Proportion to the second, as the third hath to the first.

6. In the Rule of Three, the greatest Difficulty is to discover the Order of the 3 Terms of the Question pro-

pounded.

Chap.

pounded, viz. which is the first, second, and the third; which that you may understand, observe, that the discipline given Numbers, two always are of one Kind, and the other as of the same Kind with the proportional Number that is sought; as in this Question, viz. If 4 Yards of Cloth con 12 Shillings, what will 6 Yards cost at that Rate? Here the two Numbers of one Kind are 4 and 6, viz. they both signify so many Yards, and 12 s. is the same Kind with the Number sought, for the Price of 6 Yards is sought.

Again observe, That of the 3 given Numbers, those two that are of the same Kind, one of them must be the first, and the other the third, and that which is of the same Kind with the Number fought, must be the second Number in the Rule of Three; and that you may know which of the faid Numbers to make your first, and which your third, know this, that to one of thefe two Numbers, there is always affixed a Demand, and that Number upon which the Demand lieth, must always be reckoned the third Number. As in the forementioned Question, the Demand is affixed to the Number 6, for it is demanded, what 6 Yards will cost, and therefore 6 must be the third Number, and 4 (which is of the fame Denomination or Kind with it) must be the first, and confequently the Number 12 must be the second; and then the Numbers being placed in the formentioned Order, will fland as followeth, viz.

yards s. yards
4 12 6

7. The next Thing is, to find out the fourth Number in Proportion; which that you may do, multiply the fecond Number by the third, and divide the Product thereof by the first, or (which is all one) multiply the 3d Term (or Number) by the fecond, and divide the Product thereof by the first, and the Quotient thence arising is the 4th Number in a direct Proportion, and is the Number sought, or Answer to the Question, and is of the same Denomination that the second Number is of. As thus, Let the same Question be again repeated, viz. If 4 Yards of Cloth cost 12 Shillings, what will 6 Yards cost?

Having placed my Numbers according to the fixth Rule (of this Chapter) foregoing, I multiply (the fecond Number) 12, by (the third Number) 6, and the Product is 723 which Product I divide by (the first Number 4, and the Quotient thence arising is 18, which is the 4th Proportional or Number sought, viz. 18 Shillings, (because the second Number is Shillings) which is the Price of 6 Yards, as was required by the Question. See the Work following.

	32 32	
	(0)	

Quest. 2. Another Question may be this, viz. If 7 C. of Pepper cost 28 1. how much will 16 C. cost at that Bare?

To resolve which Question, I consider that (according to the fixth Rule of this Chapter) the Terms or Numbers ought to be placed thus, viz. the Demand lying upon 16 C. it must be the third Number, and that of the same Kind with it must be the first, viz. 7 C. and 21 l. (being of the same Kind with the Number sought) must be the second Number in this Question; then I proceed according to this seventh Rule, and multiply the second Number by the third, viz. 21 by 16, and the Product is 336, which I divide by the first Number 7, and the Quotient is 48 l. which is the Value of 16 C. of Pepper at the Rite of 21 l. for 7 C. See the Work following.

8. If when you have divided the Product of the 2d and 3d Numbers by the first, any Thing remain after Division is ended, such Remainder may be multiplied by the Parts of the next inferior Denomination, that are equal n an Unit (or Integer) of the fecond Number in the Question, and the Product thereof divide by the first Number in the Question, and the Quotient is of the same Denomination with the Parts by which you multiplied the Remainder, and is Part of the 4th Number which is fought, And furthermore, if any Thing remain, after this last Division is ened, multiply it by the Parts of the next inferior Denomination equal to an Unit of the last Quorient, and divide the Product by the same Divisor, (viz. The first Number is the Question) and the Quote is still of the same Denomination with your Multiplier; follow this Method until you have reduced your Remainder into the lowest Denomintion, &c. An Example or two will make this Rule very plain, which may be the following.

Quest. 3. If 13 Yards of Velver, dec. cost 21 l. whi will 27 Yards of the same cost at that Rate?

Pri chi

oo, the tion and

herendomie the er is nomil you

Having Odered and wrought my Numbers according to the 6th and 7th Rules of this Chapter, I find the Quotient tobe 43 1. and there is a Remainder of 8, so that I con-Jude the Price of 27 Yards to be more than 43 1. and to the Istent that I may know how much more, I work according to the foregoing Rule, viz. I multiply the faid Remainder 8 by 20 s. (because the second Number in the Question was Pounds) and the Product is 160, which divided by the first Number, viz. 13. it quotes 12. which are 12 Shillings; and there is yet a Remainder of 4, which I multiply by 12 Pence (because the last Quotient was Shilings) and the Product is 48, which I divide by 13 (the first Number) and the Quotient is 3 d. and yet there remaineth 9, which I multiply by 4 Farthings, and the Product is 56, which divided by 13 again, it quotes 2 Farthings, and there is yet a Remainder of 10, which (because it cometh not to the Value of a Farthing) may be neglected; or rather fet after the 2 Farthings over the Divisor, with a Line between them; and then (by the 21ft and 22d Definitions of the first Chapter of this Book) it will be 10 of a Farthing, fo that I conclude, that if 13 Yards of Velver cost 21 l. 27 Yards of the same will cost 43 1. 12. 3d, 2 12 grs. which Fraction is 10 Thirteens of a Farthing. See the Operation as followeth;

Quest. 12. A Draper bought of a Merchant 50 Pieces of Keisey, each Piece containing 34 Ells English, (the El Flemish being three Quarters of a Yard) to pay after its Rate of 85. 4d. per Ell Flemish, I demand how much the 50 Pieces cost him at that Rate?

4

First find out how many Ells Flemish are in the so Pieces, by multiplying 50 by 34, the Product is 1700 which bring into Quarters by 3, it makes 5100 Quarters then proceed as in the last Question, and the Answerse will find to be 102000 Pence, or 425 l. See the Operation as followeth.

By

By this time the Learner is, as I suppose well exercised in the Practick and Theorick of the Rule of Three Direct; but at his Leisure he may look over the following Question, whose Answers are given, but the Operation purposely of mitted as a Touchstone for the Learner, thereby to my his Ability in what hath been deliver'd in the former Rules.

Quest. 16. If 24 l. of Raisirs cost 6 s. 6 d. what will 18 Frails cost, each weighing neat 3 grs. 18 l. Ans. 241.

17 s. 3 d.

Quest. 17. If an Ounce of Silver be worth 5 Shillings, what is the Price of 14 Ingots, each Ingot weighing 71. 5 02. 10 p. w. Answer 313 1. 5 s.

Quest. 18. If a Piece of Cloth cost 101. 16 s. 8 d. I demand how many Ells Engl. there are in the same, when the Ell at that Rate is worth 8 s. 4 d. Answ. 26 Ells English.

Quest. 19. A Factor bought 84 Pieces of Stuffs, which cost him in all \$37 l. 12 s. at \$ s. 4 d. per Yard. I demand how many Yards there were in all, and how many Elk English were contained in a Piece of the same? Answere 2016 Yards in all, and 19 \(\frac{1}{2}\) Ells of English per Piece.

Quest. 10. A Draper bought 242 Yards of Broad-cloth, which cost him in all 254 1. 10 s. for 86 Yards, of which he gave after the Rate of 21 s. 4 d. per Yard. I demand how much he gave per Yard for the Remainder? Answer

20 s. 9 d. - Faper Yard.

Quest. 21. A Fastor bought a certain Quantity of Serge and Shalloon, which together cost him 126 l. 14 s. 10d. The Quantity of Serge he bought was 48 Yards, at 41 4 d. per Yard; and for every two Yards of Serge he had; Yards of Shalloon; I demand how many Yards of Shalloon he had, and how much the Shalloon cost him per Yard!

Aniw. 120 Yards of Shalloon at 1 l. 15.s. 5 d. 120 per 9d.

Quest. 22. An Oilman bought three Tuns of Oil, which cost him 151 l. 14s. and so it chanced that it leaked out 85 Gallons; but he is minded to sell it again, so that he may be no Loser by it; I demand how he must sell it po

Gallon? Answer, at 4 s. 6d. 174 d. per Gallon.

Quest. 23. Bought 9 Packs of Cloth, each Pack of taining 12 Cloths, which at 8s. 4d. Ell Flemish, col 1050 l. I demand how many Yards there were in each Cloth? Answer 27 Yards in each Cloth.

Quest. 24. A Gentleman hath 536 l. per Ann. and his Expences are, one Day with another 18 s. 10 d. 3 grs. I defire to know how much he layeth up at the Year's End?

Answer 191 l. 3 s. 8 d. 1 gr.

Quest. 25. A Gentleman expendeth daily one Day with another 27 s. 10 d. \(\frac{1}{2}\). and at the Year's End layeth up. 340 l. I demanded how much is his yearly Income? An-

fwer 848 l. 14 s. 4 d. 1.

Quest. 26. If I sell 24 Yards for 101. 10 s. how many Ells Flemish shall I sell for 283 l. 17 s. 6 d. at that Rate? Answer 504? Ells Flemish.

Quest. 27. If 100 l. in 12 Months, gain 6 l. Interest, how much will 75 l. gain in the same Time, and at the

fame Rate ? Aufwer 4 1. 10 s.

Quest. 28. If 100 i. in 12 Months gain 6 i. Interest, how much will it gain in 7 Months at that Rate? Answer

Quest. 29. A certain Usurer put out 73 l. for 12 Months, and received Principal and Interest 81 l. I demand what. Rate per Cent. he received Interest? Auswer 8 l. per Cent.

Quest. 30. A Grocer bought 2 Chests of Sugar, the one weigh'd near 18 C 3 qrs. 14 l. at 2 l. 6 s. 8 d. per C. the other weighed near 18 C. 1 qr. 21 l. at 4 d. ½ per l. which he mingled together; now I defire to know how much a C. mt. of this Mixture is worth? Ans. 2 l. 4 s. 25567 qrs.

from one Place, the one goes East, and the other West the one travelleth 4 Miles a Day, and the other 5 Miles a Day, how far are they distant the 9th Day after their

Departure ? Answer 81 Miles.

Quest. 32. A flying every Day 40 Miles, is pursued the fourth Day after by B, posting 50 Miles a Day; now the Question is, in how many Days, and after how many Miles Travel, will A be overtaken?

Langw. B overtakes him in 32 Days, when they have travelled 600 Miles. See More's Arithm. cap. 8. qu 7.

contained in the Definition of the same, that is, to find a fourth Number in Proportion, confishing of two equal Reasons; as hath been fully shewn in all the foregoing Examples.

F 5

The Single Kille, &c. Chap. 13.

The second Effects is, by the Price or Value of one Thing, to find the Price and Value of many Things of like Kind.

The third Effect is, by the Price or Value of many Things, to find the Price of one; or by the Price of many Things, (the faid Price being one) to find the Price of many Things of like Kind.

The 4th Effect is, by the Price or Value of many Things, to find the Price or Value of many Things of like Kind.

The 5th Effect is, thereby to reduce any Number of Monies, Weights, or Measures, the one Sort into the other, as in the Rules of Reduction contained in the 8th Chapter foregoing. Examples of its various Effects have

been already answered.

Multiply the first Number by the 4th, [The Proof of the Rule of Three Direct.] and note the Product; then multiply the 2d Number by the 3d, and if this Product is equal to the Product of the 1st and 4th, then the Work is rightly performed, otherwise it is erroneous.

So the first Question of this Chapter (whose Answer or 4th Number we found to be 18 s.) is thus proved, viq. the first Number is 4, which multiplied by 18 (the 4th) produced 72, and the 2d and 3d Numbers are 12 and 6, which multiplied together preduceth 72, equal to the Product of the 1st and 4th, and therefore I conclude the

Work to be rightly performed.

Always observing, that if any Thing remain after you have divided the Product of the 2d and 3d Numbers by the first, such Remainder in proving the same, must be added to the Product of the 1st and 4th Numbers, whose Sum will be equal to the Product of the second and third, the second Number being of the same Denomination with the fourth, and the sirst of the same Denomination with the third.

So the fourth Question of this Chapter being again repeated, viz. If 1421. of Tobacco cost 17s. what will 478 1. cost at that Rate? The Answer, (or fourth Number) was 46 1. 1 s. 10 d. 1 qr. -1, which is thus proved; viz. bring the 4th Number into Farthings, and it makes 44294, which multiplied by the first Number 14, produceth

Chap. 11 The Single Rule. &c.

duceth 619488, (the second which remaineth being addithereto;) then (because I reduce my sourth Number into Farthings) I reduce my second, (viz. 27 s.) into Farthings, and they are 1296, which multiplied by the 3d Number 478, their Product is 619488, equal to the Product of the first and sourth Numbers: Wheretore I conclude the Operation to be true. This is an infallible Way to prove the Rule of Three Direct, and it is reduced from the 12th Section of the 9th Chapter of this Book.

And thus much for this inestimable Rule of Three Die rest, the Demonstration of which may be seen in Kersey's Appendix to Wingate's Arithm. and in the 6th Chapter of

Oughtred's Clavis Mathematica.

CHAP. XI.

The Single Rule of Three Inverse.

when there are 3 Numbers, given to find a 4th in fuch Proportion to the 3 given Numbers, so as the 4th proceeds from the 2d according to the same Rate, Reason, or Proportion, that the first proceeds from the third, or the Proportion is,

As the 5th Number is in Proportion to the 2d, fo is the

Ift to the 4th. See Alfted. Matth, 1. 2. c. 14.

So if the 3 Numbers given were 8, 12, and 16, and it were required to find a fourth Number in an inverted Proportion to theie, I say, that as 16 (the third Number) is the Double of the first Term or Number (8) so must 12, the second Number, be the double of the fourth; so will you find the sourth Term or Number to be 6. And 25 in the Rule of Three Direct) you multiply the second and third together, and divide their Product for a sourth proportional Number,

2. In the Rule of Three Inverse, you must multiply the second Term by the first, or first Term, by the second, and divide the Product thereof by the first Term, so the Quotient will give you the 4th Term sought in an inverted Proportion. The same Order being observed in this Rule, as in the Rule of Three Direct, for placing and disposing of the

given

der, that you may know whether your Question be to be resolved by the Rule Direct or Inve. se, observe the gene-

ral Rule following.

3. When your Question is stated, and your Numbers orderly disposed, Consider in the first Place, whether the fourth Term or Number sought, ought to be more or less than the second Term; which you may easily do: And if it is required to be more or greater than the 2d Term, then the lesser Extream must be your Divisor; but if it requires less, then the highest Extream must be your Divisor; in this Case; the 1st and 3d Numbers are called Extreams (in respect of the second) and having sound out your Divisor, you may know whether your Question belong to the Rule Direct or Inverse; for if the 3d Term be your Divisor, then it is Inverse; but if the 1st Term be your Divisor, then it is a direct Rule. As in the sollowing Questions.

Quest. 1. If 8 Labourers can do a certain Piece of Work in 12 Days, in how many Days will 16 Labourers do the

Same? Answer, in 6 Days.

Having placed the Numbers according to the 6th Rule of the 10th Chapter, I confider, that if 8 Men can finish the Work in 12 lab. Days lab. Days, 16 Men will do it in leffer (or 8 12 16

Days, 16 Men will do it in leffer (or fewer Days) than 12 therefore the biggest Extream must be the Divisor, which is 16, and therefore it is the Rule of Three Inverse; wherefore I multiply the 1st and 2d Numbers together, viz. 8 by 12, and their Pro-

16) 96 (5 Days 96 (0) Facit 6 Days

duct is 96, which divided by 16,

quotes 6 Days for the Answer; and in so many Days will 16 Labourers perform a Piece of Work, when 8 Men can

doit in 12 Days.

Quest. 2. If, when the Measure, viz. (a Peck) of Wheat cost 2 s. the Penny-loas weighed (according to the Standard Statute or Law of England) 8 Ounces, I demand how much it will weigh when the Peck is worth 1 s. 6 d. according to the same Rate or Proportion? Answer 10 sz. 23 p. w. 8 gr.

Having

e

le

Ь.

16

ys

vill

can

neat

Won

200

ring

Having placed and reduced the given Numbers according to the 6th and 9th Rules of the 1 th Chapter, I confider that at 15.6 d per Peck, the Penny-loaf will weigh more than at 25. per Peck; for as the Price decreaseth, the Weight increaseth; and as the Price increaseth, so the Weight diminishes; wherefore because the first Term requires more than the second, the lesser Extream must be the Divisor, viz. 15 6 d or 18 d. and having sinished the Work, I find the Answer to be 10 cz. 13 p. w. 8 gr. and so much will the Penny-loaf weigh when the Peck of Wheat is worth 15.6 d. according to the given Rate of 8 Ounces, when the Peck is worth two Shillings. The Work is plain in the following Operation.

d. If 24 18 oz. pw. gr. 18) 192 (10 13 8 Answer 18 12 20 - p. w. 240 (13 18 60 54 (6) 24 144 (8 Gr. 144

(0)

Queft.

The Single Rule Queft. 3. How many Pieces of Money or Merchandize at 20 s. per Piece, are to be given or received for 240 Pieces, the Value or Price of every Piece being 12 Shillings? Answer 144 Pieces. For it 12 s. required 240 Pieces, then 20 s. will require les; therefore the bigger Extream must be the Divisor, which is the third Number, Br- See the Work as in the Margent.

Quest. 4. How many Yards of 3 Quarters broad are required to double, or be equal in Measure to 30 Yards, that are 5 Quarters broad ? Answer 50 Yards. For fay, if 5 Quarters will require 30 Yards long, what Length will 3 Quarters broad require? Here I confider that ? Quarters broad will require more Yards than 30; for the narrower the Cloth is, the more in length will go to make equal Measure with a broader

Piece.

975. long 30 3) 250 (50 yds.) 1 (0)

(0)

Queft. . At the R. quest of a Friend, I lent him 200 1. for 12 Months; promiting to do me the like Courtely at my Necessity; but when I came to request it of him, he could let me have but 150 l. now I defire to know how long I may keep this Money to make plenary Satisfaction for my former Kindnels to my Friend? Aufwer 16 Months, I fay, If 200 1, will require 12 Months, what will 150 1. require; 150 !. will require more Time than 12 Months. sherefore the leffer Extream, (viz. 150) must be the Divifor; multiply and divide, and you will find the fourth in verted proportional to be 16, and fo many Mo ought to keep the 150 l. for Satisfaction.

Quest. 6. It for 24 s. I have 1200 L Weight ca 26 Miles, how many Miles shall 1800 1. be carried ney? Answer 24 Miles

Quest. 7. If for 24s. I have 1200 l. wt. carried 36 Miles, how many l. wt. shall I have carried 24 Miles for the same Money? Answer 1800 l. weight.

Quest. 8. If 100 Workmen in 12 Days finish a Piece of Work or Service, how many Workmen are sufficient to do

the fame in 3 Days? Answer 400 Workmen.

Quest. 9. A Colonel is besieged in a Town in which are soon Soldiers, with Provision of Victuals only for three Months, the Question is, How many of his Soldiers must be dismiss, that his Victuals may last the remaining Soldiers 6 Months? Answer 500 he must keep, and dismiss as many.

Quest. 10. If 20 l. worth of Wine is sufficient for the Ordinary of 100 Men, when the Tun is sold for 30 l. how many Men will the same 20 l. worth suffice when

the Tun is worth 24 1. Answer 125 Men.

Quest. 11. How much Plush is sufficient for the Cloak, which hath in it 4 Yards of 7 Quarters wide, when the Plush is but 3 Quarters wide? Answer 9 \frac{1}{2} Y is of Plush.

Queft. 12. How many Yards of Canvas that is Ell wide, will be sufficient to line 20 Yards of Say, that is 3 Quar-

ters wide? Answer 12 Yards.

Quest. 13. How many Yards of Matting that is 2 Foot wide, will cover a Floor that is 24 Foot long, and 25

Foot broad? Answer 240 Foot.

r

Quest. 14. A Regiment of Soldiers, confilling of 1000, are to have new Coats, and each Coat to contain two Yards two Quarters of Cloth that is 5 Quarters wide, and they are to be lined with Shalloon that is 3 Quarters wide, I demand how many Yards of Shalloon will line them?

Answer 16666 \(\frac{1}{2}\) Quarters, or 4:66\(\frac{1}{2}\) Yards.

Quest. 15. A Messenger makes a Journey in 24 Days, when the Day is 12 Hours long: I desire to know in how many Days he will go the same when the Day is 16 Hours

long? Answer, in 18 Days.

Quest. 16.1 borrowed of my Friend 64 l. for 8 Months, and he hath Occasion another Time to borrow of me for make good his former Kindness to me? Auswer, 42 l. The

4. The general Effect of the Rule of Three Inverse, is contained in the Definition of the same, that is, to find a fourth Term in a Reciprocal Proportion inverted to the

Proportion given.

The 2d Effect is, by two Pieces, or Value of two feveral Pieces of Money and Merchandizes known, to find how many Pieces of the one Price is to be given for fomany of the other. And so to reduce and exchange one Sort of Money or Merchandize into another. Or else to find the Price unknown of any Piece given to exchange in reciprocal Proportion.

The 3d Effect is, by two different Prices of a Measure of Wheat bought or fold, and the Weight of the Loaf of Bread, made answerable to one of the Prices of the Measure given, to find out the Weight of the same Loaf answerable to the other Price of the said Measure given.

Or else, by the two several Weights of the same priced Loat, and the Price of the Measure of Wheat answerable to one of those Weights given, to find out the other Price of the Measure answerable to the other Weight of the same Loaf.

The 4th Effect is, by two Lengths, and one Breadth of two Rectangular Planes known, to find out another Breadth unknown. Or, by 2 Breadths, and one Length given, to find out another Length unknown in an invert-

ed Proportion.

The 5th Effect is, by double Time, and a capital Sum of Money borrowed or lent, to find out another capital Sum answerable to one of the given Times; or otherwise, by two capital Sums, and a Time answerable to one of them given, to find out a Time answerable to the other

capital Sum in reciprocal Reason.

The 6th Effect is, by two different Weights of Carriage, and the Distance of the Place in Miles or Leagues given, to find another Distance in Miles answerable to the same Price of Paymert. Or otherwise by two Distances in Miles, and the Weight answerable to one of the Distances (being carried for a certain Price) to find out the Weight answerable to the other Distance for the same Price.

The 7th Effect is, by double Workmen, and the Time

answerable to one of the Numbers of Workmen given, to find out the Time answerable to the other Number of Workmen, in the Performance of any Work or Service. Or contrariwise, by double Time, and the Workmen answerable to one of those Times given, to find out the Number of Workmen answerable to the other Time, in the Performance of any Work or Service.

Also by a double Price of Provision, and the Number of Men, or other Creatures, nourished for a certain Time answerable to one of the Prices of Provisions given, to find out another Number of Men or other Creatures answerable to the other Price of rhe Provision for the same Time. Or contrariwise, by two Numbers of Men, or other Creatures nourished, and one Price of Provision answerable to one of the Numbers of Creatures given, to find out the other Price of the same Provision answerable to the other Number of Creatures, both being supposed to be nourished for the same, &c.

To prove the Operation of the Rule of Three Inverse, multiply the 3d and 4th Terms together, and note their Product; and multiply the 1st and 2d together, and if their Product is equal to the Product of the 3d and 4th, then is the Work truly wrought, but if it falleth out

otherwise, then it is erroneous.

As in the first Question of this Chapter 16 (the 3d Number) being multiplied by 6 (the 4th Number) the Product is 96, and the Product of 8, (the first Number) multiplied by 12, (the 2d Number) is 96, equal to the first Product, which proves the Work to be right.

And note, That if in Division any Thing remain, such Remainder must be added to the Product of the third and sourth Terms, and if the Sum be equal to the Product of the first and second (the Homogeneal Terms being of one Denomination), the Work is right.

CHAP. XII.

The Double Rule of Three Direct.

W E have already delivered the Rule of fingle Proportion, and we come now to lay down the Rules of Plural Proportion.

1. Plural

t. Plural Proportion is, when more Operations in the Rule of Three than one are required before a Solution can be given to the Question propounded. Therefore in Questions that require Plurality in Proportion, there are always given more than three Numbers.

2. When there are given five Numbers, and a fixth is required in Proportion thereunto, then the fixth Proportion is faid to be found out by the Double Rule of Three.

a in the Question following, viz.

If 100 1. in 12 Months gain 6 1. Interest, how much

will 75 1. gain in 9 Months?

3. Questions in the Double Rule of Three, may be refolved either by 2 Single Rules of Three, or by 1 Single Rule of Three, compounded of the Five given Numbers.

4. The Double Rule of Three, is either Direct, or ele

Inverse.

5. The Double Rule of Three Direct is, when unto 4 given Numbers, a 6th perpertional may be found out by

a

two fingle Rules of Three Direct.

6. The five given Numbers in the Double Rule of Three Direct confift of two Parts, viz. 1. A Supposition, and 2dly, of a Demand; the Supposition is contained in the three first of the five given Numbers, and the Demand lies in the two last; as in the Example of the Second Rule of this Chapter, viz. If 1001. in 12 Months gain 64. Interest, what will 751. gain in 9 Months? Here the Supposition is expressed in 100, 12, and 6, for it is said, if 1001. in 12 Months gain 61. Interest: And the Demand lieth in 75 and 9, for it is demanded, How much 751. will gain in 9 Months;

7. When your Question is stated, the next Thing will be to dispose of the given Numbers in due Order and Place, as a Preparative for Resolution: Which that you may do; First, Observe which of the given Numbers in the Suppesition is of the same Denomination with the Number required: for that must be the 2d Number (in the first Operation) of the Single Rule of Three, and one of the other Numbers in the Supposition (it matters not which) must be the first Number, and that Number in the Demand, which is of the same Denomination with the first, must be the third Number; which three Numbers being thus placed.

Chap. 12. of Three Direct.

e e et de be

115

placed, will make one perfect Question in the Single Rule of Three, as in the forementioned Example: First, I consider, that the Number required in the Question, is the Interest or Gain of 75 l. therefore that Number in the Supposition which hath the same Name, (viz. 100 6 75 must be the second Number in the first Operation, and either 100 or 12, (it matters not which) must be the first Number; but I will take a 100; and then for the third Number, I put that Number in the Demand, which hath the same Denomination with 100, which is 75; for they both signify Pounds principal) and then the Numbers will stand as you see in the Margent.

But if I had for the first Number put the other Number in the Supposition, viz. 12, which signifies 12 Months, then the third Number must have been 9, which is the Number in the Demand which hash the same Denomination with the first, viz. 9 Months.

and then they will fland as in the Margent.

There yet remain two Numbers to be disposed of, and those are one in the Supposition, and another in the Demand; that which is of the Supposition, I place under the first of the Or this, three Numbers; and the other, which is the Demand, I place under the third Number; and then two of the Terms in the Supposition will stand (one over the other) in the first Place, and the two Terms in the Demand will stand (one over the other) in the third Place, as in the Margent.

8. Having disposed or ordered the given Numbers, according to the last Rule, we may proceed to a Resolution; and first I work with the; uppermost Numbers, which, according to the first Disposition, are 100, 6, and 75; which is as much as to say, If 100 l. requires 6 l. Interest, how much will 75 Pound require? which by the 3d Rule of the 11th Chap. I find to be Direct; and by the 7th and 8th Rules of the 20th Chapter, I find the 4th proportional Number to be 4 l. 10 s. so that by the foregoing single Question I have discovered how much Interest 75 l. will gain in 12 Months; the Operation whereof soluweth on the less Hand under the Letter A, and having discovered how the less than 10 months.

discovered how much it will gain in 12 Months, we my by another Question easily discover how much in will gain in 9 Months; for this 4th Number (thus found) I put in the Middle between the two lowest Numbers of the 5, after they are placed according to the 7th Rule or this Chapter, and then it will be a 2d Number, in another Question in

the Rule of Three. The Numbers being 12 4 10 9 the first and third Numbers being of one Denomination, viz. both Months, and may be thus expressed; if 12 Months require 4 l. 10 s Interest, what will 9 Months require? And by the 3d Rule of the 11th Chapter, I find to be the Direct Rule, and by working according to the Directions laid down in the 7th, 8th, and 9th Rules of the 10th Chapter, I find the sourth proportional Number to last single Question, to be 3 l. 7 s. 6 d. which is the fixth proportional Number to the 5 given Numbers, and is the Answer to the general Question. The Work of the last single Question is expressed on the right Side of the Page under the Letter B, as followeth.

age under the Letter B, as	followeth.

76

So that by the feregoing Operation, I conclude, that if 100 L in 12 Months gain 6 L Interest, 75 L will gain 3 L 7 s. 6 s. in 9 Months, after the same Rate.

The Answer would have been the same if the 12 9 9 given Numbers had been ordered according to the second Method, viz. as you see in the Margent.

For first, I say, if twelve Months gain 6 1. what will 9 Months gain? This Question I find to be Direct, by the 3d Rule of the 1 1th Chapter, and by the 7th and 8th Rules of the 1 oth Chapter, I find the fourth proportional

Number to these three to be 4 1. 10 s.

Thus have I found out what is the Interest of 100 1. for 6 Months, and I am now to find the Interest of 75 1. for 9 Months; to effect which, I make this 4th Number (found as before) to be my second Number in the next Question, I say, If 100 1. require 4 1. 10 s. what will 75 1. require? This Question, I find (by the said 3d Rule of the 11th Chapter) to be Direct, and by the said 7th, 8th, and 9th Rules of the 10th Chapter, I find the Answer to be as before, viz. 3 1. 7 s. 6 d.

The Operation of this Rule in the following Questions, are purposely omitted, to try the Learner's Capacity.

Quest. 2. A 2d Example in this Rule may be as followeth, viz. A Carrier receiving 42 Shillings for the Carriage of 300 Weight 150 Miles, I demand how much he ought to receive for the Carriage of 7 C. 3 grs. 4 l. 50 Miles at that Rate? Answer 36 s. 5 d.

Quest. 3. A Regiment of 136 Soldiers eat up 351 Quarters of Wheat in 108 Days, I demand how many Quarters of Wheat 11232 Soldiers will eat in 56 Days at that

Rate? Aufwer 1404 Quarters.

Quest. 4. If 40 Acres of Grass be mowed by 8 Men in 7 Days, how many Acres shall be mowed by 24 Men in

28 Days? Answer 480 Acres.

Quest. 5. If 48 Bushels of Corn (or other Seed) yield 576 Bushels in a Year, how much will 240 Bushels yield in 6 Years at that Rate? That is to say, if they were sowed 240 Bushels every one of the 6 Years? Answer 17280 Bushels.

Quest. 6. If 40 Shillings is the Wages of 8 Men for 5 Days, what will be the Wages of 32 Men for 24 Days?

Answer 768 Shillings, or 38 1. 8 s.

Quest-7. If 14 Horses eat 46 Bushels of Provender in 16 Days, how many Bushels will 20 Horses eat in 24

Days? Answer 120 Bushels.

Quest. 6. If 8 Cannors in one Day spend 48 Barrels of Powder, I demand how many Barrels 24 Cannons will spend in 22 Days at that Rate? Answer 1728 Barrels.

Quest. 9. If in a Family confisting of 7 Persons, there are drunk out 2 Kilderkins of Beer in 12 Days, how many Kilderkins will there be drunk out in 8 Days by another Family consisting of 14 Persons? Answer 48 Gallons, or

2 Kilderkins and 12 Gallons.

Quest. 10. An Usurer put 75 l. out, to receive Interest for the same, and when it had continued 9 Months, he received for Principal and Interest 78 l. 75. 6 d. I demand at what Rate per Cent. per Annum, he received Interest? Answer 6 l. per Cent. per Annum.

CHAP. XIII.

The Double Rale of Three Inverse.

THE Double Rule of Three Inverse, is, when a Question in the Double Rule of Three is resolved by two Single Rules of Three, and one of those single Rules salls out to be Inverse, or requires a fourth Number in Proportion reciprocal (for both Questions are never Inverse.

2. In all Questions of the Double Rule of Three (25 well Inverse as Direct) you are in the disposing of the 5 given Numbers, to observe the 7th Rule of the 12th Chapter, and in resolving of it by two single Rules, observe to make Choice of your Numbers for the first and single Questions, according to the Directions given in the 8th Rule of the same Chapter, and in the Example following viz.

Quest. 1. If 100 l. Principal in 12 Months gain 6 l. Interest, what Principal will gain 3 l. 7 s. 6 d. in 9

Months?

e

P

to gle th

1.

This Question is an Inversion of the first Question of the 12th Chapter, and may serve for a Proof thereof.

In order to a Resolution, I dispose of the 5 given Numbers, according to the 9th Rule of the last Chapter; and being so disposed, they will stand as solloweth.

12	COL	9	l. s.	d.
.6	Or thus	,	1. s. 3 7	6
6	100	1.	s. d	

Here observe, That according to the 8th Rule of the 12th Chapter, the first Question (if you take it from the 5 Numbers (as they are ordered or placed first) will be, if 12 Months, require 100 l.

Principal, what will 9 Months require to make the same Interest? This (according to the 3d Rule of the 12th Chap-

ter) is Inverse, and the Answer will be found (by the 2d Rule of the 11th Chapter) to be 133 l. 6 d. 8 d. The 2d Quefion then will be, If 6 l Inte-

reft require 133 l. 6 s. 8 d. Principal; how much Principal will 3 l. 7 s. 6 d. require? This is a direct Rule, and the

Answer in a direct Proportion, 75 l. See the Work.

First I fay, m | m 12 100 9

Dir

othe

be gained by 75 1. in 9 Months.

But if the Resolution had been sound out by the Number as they are ranked in the second Place, then the cond Question in the Sirgle Rule would have been Invest, and the first Question Direct, and the Conclusion in same with the first Method, viz. 75 1.

Quest. 2. If a Regiment confisting of 939 Soldiers, as eat up 351 Quarters of Wheat in 168 Days, how may Soldiers will eat up 1404 Quarters in 56 Days at the

Rate? Answer 11232 Soldiers.

Quest. 3. If 12 Students in 8 Weeks spend 48 1. Ide mand how many Students will spend 288 1. in 18 Weeks Answer 32 Students.

nap. 14. The Rule of Three, occ. 12

Quest. 4. If 48 l. serve 12 Students 8 Weeks, how many Weeks will 288 l. serve 4 Students? Answer 144 Weeks.

Quest. 5. It when a Bushel of Wheat cost 3 s. 4 d. the Penny Loaf weigheth 12 Ounces, I demand the Weight of the Loaf worth 9 d. when the Bushel cost 10 s. Answer 36 Ounces

Quest. 6. If 48 Pioneers in 12 Days cast a Trench 24 Yards long, how many Pioneers will cast a Trench 163

Yards long in 16 Days? Answer 252 Pioneers.

Quest. 7. If 12 C. weight being carried 100 Miles, cost 51. 11 s. I desire to know how many C. weight may be carried 150 Miles for 12 l. 12 s. at that Rate? Ans. 18 C.

Quest. 8. If when Wine is worth 30 l. per Ton, 20 l. worth is sufficient for the Ordinary of 100 Men, how many Men will 4 l. worth suffice, when it is worth 24 l. per Ton? Answer 25 Men.

Quest. 9. If 6 Men in 24 Days mow 72 Acres; in how many Days will 8 Men mow 24 Acres? Ans. In 6 Days.

Quest. 10. If when the Ton of Wine is worth 30 1. 100 Men will be satisfied with 20 1. worth, I desire to know what the Ton is worth when 4 1 worth will satisfy 25 Men at the same Rate? Answer 24 1. per Ton.

CHAP. XIV.

The Rule of Three composed of Five Numbers.

THE Rule of Three composed, is when Questions (wherein there are 5 Numbers given to find a 6th in Proportion thereunto) are resolved by one single Rule of Three composed of the 5 given Numbers.

2. When Questions may be perfo med by the Double sule of Three Direct, and it is required to resolve them by the Rule of Three composed; first order or rank your Numbers according to the 7th Rule of the 12th Chap, then

The Rule is.

Multiply the Terms or Numbers (that stand one over the other in the first Place) the one by the other, and make their Product the first Term in the Rule of Three Direct; then multiply the Terms that stand one over the other in the third Place, and place their Product for the

Week!

. Inte-

d. will

Num

the fo

nverk

on the

ers, @

W many

at the

1. 14

34

So the first Question of the 12th Chapter being proposed, viz. If 100 l. in 12 Months gain 6 l. Intereft, what will 75 L. gain in 9 Months? The Numbers being ranked for

4th Proportional fo found shall be the Answer required.

placed) as is there directed and done.

Then I multiply the two first Terms, 100 and 12, the one by the other, and their Product is 1200 for the first Term; then I multiply the two last Terms 75 and 9 together, and their Product is 675 for the third Term. I fav, as 1200 is to 6, fo is 675 to the Answer, which by the Rule of Three Direct, will be found to be 31.7 s. 64

as was before found.

2. But if the Question he to be answered by the Double Rule of Three Inverse, then (having placed the 5 given Terms as before) mulciply the lowermost Term of the first Place, by the uppermost Term of the third Place, and per the Product for the first Term ; then muliply the uppermost Term of the first Place, by the lowermost Term of the third Place, and put the Product for the third Tem. and the fecond Term of the three highest Numbers for the middle Term to those two; then if the Inverse Proportion is found in the uppermost three Numbers, the fourth Proportional Direct to these three shall be the Arfwer. So the first Question to the 13th Chapter being flated, viz. If 100 l. Principal in 12 Months gain 6 l. h. tereft, what Principal will gain 3 1. 7 s. 6 d. in 9 Month! State the Number as there directed in the first Order, vir.

Per

ma

full

Dou

fing

each

Tim

ath the t in th

of th

divid

DCI

Then reduce the 6 l. and 3 l. 7 s. 6 d. into Pence, the 6 l. Ther 1440 d. and 3 l. 7 s 6 d. is 810 d. then multiply 1440# 9, the Product is 12960 for the first Term in the Rule for t Three Direct, and multiply 810 by 12, the Product i 9 20, for the third Term ; then I fay, as 12960 is to 130 to is 9720 to the Answer, viz. 75 l. as before. But ter, a the Terms had been placed after the second Order, w cular

Chap. 1	5 Single Fellowship.	123
6	. l. l. s.	d. 6

Then the Inverse Proportion is found in the lowest Numbers, and having composed the Numbers for a single Rule of Three, as in the second Rule foregoing; then the Anfwer must be found by a single Rule of Three Inverse; for here it falls out to multiply 810 by 12 for the first Number, 1440 by 9 for the Third Number; and then you mult fay. As 9720 is to 100 l. fo is 12960 to the Answer, which by Inverie Proportion will be found to be 75 1, as before.

The Question in the 12th and 13th Chapters may ferve

for thy farther Experience.

CHAP. XV.

Single Fellowship.

TFllowship, is that Rule of Plural Proportion, whereby we ballance Accompts depending between divers Persons having put together a general Stock, so that they may every Man have his proportional Part of Gain, or fullain his proportional Part of Loss.

2. The Rule of Fellowship is either single, or it is

Double.

CHAP. XVII.

Alligation Medial,

Proportion by which we resolve Questions, wherein is a Composition or Mixture of divers Simples, as also it is useful in Composition of Medicines, both for Quantity, Quality, or Price: And it Species are two; viz. Medial and Alternate.

2. Alligation Medial, is, when having the several Quantities and Prices of several Simples propounded, we discover the mean Price or Rate of any Quantity of the Mixture compounded of those Simples, and the Proportion is.

As the Sum of the Simples to be mingled is to the total Value of all the Simples, so is any Part or Quantity of the Composition or Mixture to its mean Rate or Price.

Quest 1. A Farmer mingled 20 Bushels of Wheat at 5 s. per Bushel, and 36 Bushels of Rye at 3 s. per Bushel, with 40 Bushels of Barley at 2 s. per Bushels now I defire to know what one Bushel of that Mixture is worth?

To resolve this Question, add together the given Quantities, and their Value, which is 90 Bushe's, whose total Value is 14 l. 8 s. as appeareth by the Work following. For,

1	Sushels so of Wheat,, at 5 s. per Bushel, is		5,
	36 of Rve, at 3 s. per Buihel, is 40 of Barley, at 2 s. per Bufhel, is	5	8
The Sum of their given Quantities is		14	-

Then say, by the Rule of Three Direct, if 95 Bushels-

the ! frior

So

ther,

inked

a C. wt. of that Mixture.

Answer 21. 13 s. 1 d. . 7. 3. The Proof of this Operation, is by the Price of any Quantity of the Mixture, to find out the total Value of the whole Composition, and if it is equal to the total Value of the several Simples, the Work is right, otherwise not [The Proof of Allegation Medial]. As in the first Example, the Answer to the Question was, that 3 s. is the Price of I Bushel; wherefore I say, by the Rule of Proportion, if I Bushel be 3 s. what is 96 Bushels ? Answer, 141. 8 s. which is the total Value of the feveral Simples: Where fore the Work is right.

CHAP. XVIII.

Alligation Alternate.

Lligation Alternate is, when there are given the particular Prices of feveral Simples, and thereby we ancover such Quantities of those Simples, as being 32 an mingled together, shall bear a certain Rate propounded

2. When such a Question is stated, place the given Priees of the Simples one over the other, and the propounded Price of the Composition against them in such Sort, that it may represent a Root, and they as fo many Branches springing from it, as in the following Example.

Queft. 1. A certain Farmer is defirous to mix 20 Bushels of Wheat at 5 s. or 60 d. per Bushel, with Rye at 3 s. or 26 d. per Buthel, and with Barley at 2 s. or 24 d. per Bushel, and Oats at 1 s. 6 d. per Bushel, and defireth to mix fuch a Quantity of Rye, Barley and Oats, with the 20 Bushels of Wheat, as that the whole Composition may be worth 2 s. 8 d. or 32 d. per Bufhel.

The Prices of the Simples being placed according to the last Rule (with the Price of the Composition propounded

as a Root to them) will stand as followeth.

60 Pence

2. Having thus placed the given Numbers, you are to link the several Rates of the Simples one to the other, by certain Arches, in fuch Sort, that one that is leffer than the mean Rare, may be coupled to another that is greater than the mean Rate; so the Question last propounded will stand

2. Or thus. I. Thus, 3. Or thus 60

4. Then take the Difference between the Root and the leveral Branches, and place the Difference of each against the Number or Branch with which it is coupled or linked, and having taken all the Differences and placed them as aforesaid, then those Differences so placed, will shew you the Number of each Simple to be taken to make a Compofiion to bear the mean Rate propounded.

ven the So the Branches of the last Question being linked togethereby ther, as in the Manner, I fay, the Difference between s being 32 and 60, is 28; which I put against 18, because 60 is unded linked with 18, then the Difference between 32 and 36 is What 4 which I put against 24, because 36 is linked or

e of alue not. xam Price rtion,

1. 8 %

V here-

any

er

is nd

5 s. rith e of

Difference between 32 and 18 is 14, which I place against 60; and then the Work will stand

as you fee in the Margent.

So I conclude that a Composition made of 14 Bushels of Wheat at 6 d. per Bushel, and 8 Bushels of Rye at 36 d. per Bushel, and 5 Bushels of Barley at 24 d. per Bushel, and 28 Bushels of Oats at 18 d. per Bushel, will bear the mean Price of 32 d. or 2 s. 8 d. per Bushel, And here observe, That in the Composition there is but 14 Bushels of Wheat; but I would mingle 20 Bushels, and this Kind (or rather Case) of Alligation Alternate, (viz.) when there is given a certain Quantity-of one of the Simples, and the Quantities of the rest sought to mingle with this given Quantity, (that the whole may bear a Price propounded) is called Alternation Partial.

And the Proportion to find out the several Quantities to

be mingled with the given Quantity, is thus-

As the Difference annexed to the Branch, that is, the Value of an Integer of the given Quantity is to the other particular Differences, so is the Quantity given to the seve-

ral Quantities required.

So here, to find how much Rye, Barley, and Oats, must be mingled with the 20 Bushels of Wheat, I say, by the Rule of Three direct, if 14 Bushels of Wheat require? Bushels of Rye, what will 20 Bushels of Wheat require? Answer, 11 -6 Bushels of Rye.

Again, It 14 Bashels of Wheat require 4 Buthels of Barley, what will 20 Bushels of Wheat require? Ans. 51 Bushels of Barley. Again, I say, if 14 Bushels of Wheat require 28 Bushels of One, what will 20 Bushels of Wheat

require? Answer, 40 Bushels of Out.

And now I say, that 20 Bushels of Wheat mingled with 3 12 1/4 Bushels of Rye, and 5 1/2 Bushels of Barley, and 40 Bushels of Oats, each bearing the Rate as afore said, will make a Composition or Heap of Corn, that may yield 32 do not be Bushels.

But if the Branches had been coupled according to the second Order, or Manner, the Differences would have been thus placed, viz. the Difference.

between 33 and 60 is 28, which I fet against 24, because 60 is linked thereto; and the Difference between 32 and 36 is 4, which I set against 18; and the Difference between 32

 $32 \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \begin{vmatrix} 8 \\ 14 \\ 28 \\ 4 \end{vmatrix}$

and 24 is 18, which I fet against 60; then the Difference between 32 and 18 is 14, which I set against his Yoke-fellow 36; and then I conclude, that if you mixt 8 Bushels of Wheat with 14 Bushels of Rye, 28 Bushels of Barley, and 4 Bushels of Oats, each bearing the aforesaid Prices, the whole Mixture may be sold for 32 d. per Bushel, as by the

Work in the Margent.

2 6

Ex

You see by this Work we have found how many Bushels of Rye, Barley, and Oats, ought to be mixed with 8 Bushels of Wheat, and to find out how many of each ought to be mixed with 20 Bushels of Wheat, I say, as 1 is to 14, so is 20 to 35 Bushels of Rye. As 8 is to 28, so is 20 to 70 Bushels of Barley. As 8 is to 4, so is 20 to 10 Bushels of Oats; whereby I conclude, that if to 20 Bushels of Wheat I put 35 Bushels of Rye, 70 Bushels of Barley, and 10 Bushels of Oats, bearing each the aforesaid Price per Bushel, that then a Bushel of this Mixture will be worth 32 d. or 2 s. 8 d.

And if the Branches had been linked, as you see in the 3d Place, where each Branch bigger than the Root is link'd to two that are lesser than the Root, then in this Case you must have placed the several Differences between the Root and Branches, against those two with which each is coupl'd, as first, the Difference between 32 and 60 is 28, which I set against 24 and 18, because it is coupled with them

 $32 \begin{cases} 60 \\ 30 \\ 24 \\ 18 \end{cases} \begin{vmatrix} 8 & 14 & 22 \\ 8 & 14 & 22 \\ 28 & 4 & 32 \\ 28 & 4 & 33 \end{vmatrix}$

both; then the Difference between 32 and 36 is 4, which I fet likewife against 3, and 18, because 36 is linked to them both, then the Difference between 32 and 24 is 8, which I put against 60 and 36, because 24 is linked to them.

them both, then the Difference between 32 and 18 is 14, which I put against 60 and 36, the Yoke-Fellows of 18.

Lastly, I draw a Line behind the Differences, and add the Differences which stand against each Branch, and put the Sum behind the said Line against its proper Branch, as you see in the Margent

And now by this Work, I find that 22 Bushels of Wheat mingled with 22 Bushels of Rye, and 32 Bushels of Barley, and 32 Bushels of Oats, each bearing the said Price, will make a Mixture bearing the mean Rate of 32 d. per Bushel.

And to find how much of each of the rest must be ming-

led with 20 Bushels of Wheat, I say,

As 22 is to 32, fo is 20 to 29 Bushels of Rye. As 22 is to 32, fo is 20 to 19 3 Bushels of Barley. As 22 is to 32, so is 20 to 29 3 Bushels of Oats.

Whereby you see the Questions of Alligation Alternate, will admit of more true Answers than one; for we have

found 3 several Answers to this 1st Question.

The Proof of Alternation Partial.

Questions of Alligation Partial are proved the same Way with Questions in Alligation Medial, which you may

fee in the 3d Rule of the 17th Chapter.

Quest. 3. A Grocer hath 4 Sorts of Sugar, viz. of 12 d. per l. of 10 d. per l. of 6 d. per l. and of 4 a. per l. and would have a Composition worth 8 d. per l. the whole Quantity whereof should contain 144 l. made of these sorts. I demand how much of each he must take.

Questions of this Nature are resolved by that Part of Alligation Alternate, called by Arithmeticians Alligation Total, viz. where there is given the Sum and Prices of several Simples, to find out how much of each Simple ought to be taken to make the said Sum or Quantity, so that it may

bear a certain Rate propounded.

To refolve this Operation, I place the several Prices of the Simples and Mean Rate propounded, and link them together, as is directed in the 2d and 3d Rules of this Chapter, and place the Differences between the Root and Branches, according to the 4th Rule of this Chapter, which will then stand one of these 3 Ways, viz.

24

5. Then add the several Differences together, which I have done, and the Sums of the first and second Order are 12 l. and of the 3d, 24 l. as you see above. But it required that there should be 144 l. of the Composition, therefore to find the Quantity of each Simple to make the whole Composition 144 l. Observe this general Rule, viz.

As the Sum of the Differences is to the several Differences, so is the total Quantity of the Composition to the

Quantity of each Simple.

S

lt

r

n

So to find how much of each Sort of Sugar I ought to take to make 144 l. at 8 d. per l.

As 12 is to 4, fo is 144 to 48 1. at 12 d. per 1.

As 12 is to 2, fo is 144 to 24 l. at 10 d. per l.

As 12 is to 2, fo is 144 to 24 l. at 6 d. per l.

As 12 is to 4, fo is 144 to 48 l. at 4 d. per l.

Whereby I find that 48 l. at 12 d. per l. and 24 l. at 10 d. per l. and 24 l. at 6 d. per l. and 48 l. at 4 d. per l. will make a Composition of Sugar containing 144 l. worth 8 d. per l.

But as the Branches are linked in the 2d Order, the Anfiwer will be 24 l. at 12 d. per l. and 48 l. at 10 d. per l. and 48 l. at 6 d. per l. and 24 l. at 4 d. per l. to make the said

Quantity, and to bear the faid Price.

And it you had work'd as the Branches are linked after the third Order, then you would have found the Quantity. of 36 l. of each.

Quest. 3. A Vintner hath four forts of Wine, viz. Carary

at 10 s. per Gallon, Malaga at 8 s. per Gallon, Rhenishwine at 6 s. per Gallon, and White-wine at 4 s. per Gallon, and he is minded to make a Composition of them all of 60 Gallons, that they may be worth 5 s. per Gallon, I desire to

know how much of each he must have?

and the Difference between the Root, (viz.) 5 and 4, which is 1, must be set against the 3 other, because it is linked to them all; so I find 1 Gallon of Canary, 1 Gallon of Malaga, 1 Gallon of Rhenish wine, and 9 Gallon of Whitewine, prized as above, being mingled together, will be worth 5 s. per Gallon, the Sum being 12 Gallons; but there must be 60 Gallons; whereof I say,

As 12 is to 1, fo is 60 to 5 Gallons of Canary.
As 12 is to 1, fo is 60 to 5 Gallons of Malaga.

As 12 is to 1, fo is 60 to 5 Gallons of Rhenish.

As 12 is to 9, so is 60 to 45 Cal. of White-wine. fo that 5 Gallons of Canary, 5 Gallons of Malaga, 5 Gallons of Rhenilly, and 45 of White wine, mingled together,

will be in all 60 Gallons worth 5 s. per Gallon, which was

required.

Quest. 4. A Goldsmith hath Gold of four several Sorts of Fineness, viz. of 24 Carects fine, and of 22 Carects fine, of 2. Carects fine, and of 15 Carects fine. [ReadChap. 2. Def. 2. of this Book.] And he would mingle so much of each with Allay, that the whole Mass of 28 Ounces of Go'd so mingled, may bear 17 Carects fine. I demand how much of each he must take? The 2d and 3d Rules of this Chapter being observed; (for instead of the Allay I put 0, because it bears no Fineness, but it makes a Branch in the Operation) the Terms may be alligated, and the Differences added by any of these 4 Ways following, viz.

First,

More Ways may be given for the alligating or linking of the Terms in this Question, but these, if well practised, are sufficient for understanding the Rules of Alligation

In Questions of Alligation l'otal the Answer is given true, when the Sum of each of the Quantities of Simples found, [The Proof of Alternation Total] agrees with the Sum or Quantity propounded; as in the last Question, the Answer was 8 67. 10 p. w. of 24 Carects fine, 10 07. of 22 Carects fine, 9.67. 10 p. w. of 20 Carects fine, 4 of

25 Carees fine, and 5 07. of Alloy, which added together, make 28 07. the Quantity propounded.

CHAP. XIX.

Reduction of Vulgar Fractions.

1. W HAT a Vulgar Fraction is, hath been already shewed, in the first Chapter of this Book, to which I refer the Reader to look cautiously into.

2. To reduce a Vulgar Fraction, observe carefully

these 8 following Rules.

1. To reduce a mixt Number into an improper Fraction.

2. To reduce a whole Number into an improper Fraction.

3. To reduce an improper Fraction into its equiva. lent Whole, (or Mixt) Number.

4. To reduce a Fraction into the lowest Terms equiva-

lent to the Fraction given.

5. To find the Value of a Fraction in the known Parts of Coin, Weight, Measure, &c.

6. To reduce a Compound Fraction to a fimple one of

the same Value.

7. To reduce divers Fractions having unequal Denominations, to Fractions of the same Value, having an equal Denominator.

8. To reduce a Fraction of one Denomination to ano-

ther of the same Value.

I. To reduce a mixt Number to an improper Fraction.

The Rule is.

Multiply the Integer Part (or whole Number) by the Denominator of the Fraction [Vide Chap. 1. Defin. 31.] and to the Product add the Numerator, and that Sum place over the Denominator for a new Numerator, fo this new Fraction shall be equal to the mixt Number given. As for Example.

1. Reduce 18 \(\frac{3}{2}\) into an improper Fraction, multiply the whole Number 18 by 7 the Denominator, and to the Product add the Numerator 3, the Sum is 129, which put over the Denominator 7, and it makes 129 for the

Answer as followeth.

an D •

.

ts

18 3

Facit 129

2. Reduce 113 : to an improper Fraction, facit, 2201
3. Reduce 50 ! to an improper Fraction, facit, 11 10

II. To reduce a Whole Number into an improper Praction.

The Rule is, Multiply the given Number by the intended Denominator, and place the Product for the Numerator over it. [Vide Chap. 1. Defin. 23.] As for Example.

I. Let it be required to reduce 15 into a Fraction, whose Denominator shall be 12. To effect 15 which, I multiply 15 by the intended 12 Denominator (12) the Product is 180, which I place over 12 as a Numerator, 30 and it makes 182, which is equal to 15 Facit 182 15 as was required; as per Margent. 180

2. Reduce 36 into an improper Fraction, whose Deno-

minator shall be be 26, Facit 916.

3. Reduce 135 into an improper Fraction, whose De-

III. To reduce an improper Fraction into its equivalent whole or mixt Number.

The Rule is; Divide the Numerator by the Denominator, and the Quotient is the whole Number equal to the Fraction, and if any Thing remain, put it for a Numerator over the Divisor. Example,

1. Reduce 43 6 into its equivalent mixt Number. Divide the Numerator 436 by the Denominator 8, and the Quotient is 54, and 3 remains, which put for a Numerator over the Divisor 8, the Answer is 54%, as followeth.

8) 436 (54

36 Facit 54% 32

1

0

n

2. Reduce 1476 to a mixe Number, Facit 23117.

3. Reduce 25 178 to a mixt Number, Facit 114, 38.

IV. To reduce a Fraction into its lowest Terms equivalent to the Fraction given.

The Rule is, 1. If the Numerator and Denominator are even Numbers, take half the one and half of the other, as often as may be, and when either of them falls out to be an odd Number, then divide them by any Number that you can discover will divide both Numerator and Denominator without any Remainder; and when you have thus proceded as low as you can reduce them, then this new Fraction for found out, thall be the Fraction you define, and will be in Value equal to the given Fraction.

Example. 1. Let it be required to reduce 124 into its

lowest Terms. First I take

the Half of the Numera-129 | 96 | 48 | 24 | 12 | 4 107 192, and it is 96, then 336 | 168 | 84 | 42 | 21 | 7 Half of the Denominator,

and it is 168, so that it is brought to $\frac{26}{162}$, and next to $\frac{48}{162}$ and by halfing still, to $\frac{24}{48}$ and their half is $\frac{1}{27}$; and now I can no longer half it, because 21 is an odd Number, wherefore I try to divide them by 3, 4, 5, 6, 6. and I find 3 divides them both without any Remainder, and brings em to $\frac{4}{16}$, as per Margent.

So I conclude 4 thus found to be equal in Value to the

given Fraction 193.

2. What is $\frac{1036}{1034}$ in its lowest Terms? Answ. $\frac{7}{8}$.

3. What is $\frac{1342}{1332}$ in its lowest Terms? Answ. $\frac{11}{13}$.

The best Way to reduce a Fraction into its lowest Terms, is, by finding a common Measurer, viz. the greatest Number that will divide the Numerator and Denominator withoutany Remainder, and by that Means reduce a Fraction to its lowest Terms at the first Work; and to find out this common Measurer, divide the Denominator by the Numerator, and if any thing remains, divide your Divisor thereby; and if any thing yet remain, then divide your last Divisor by it, do so until you find nothing remaining: Then this last Divisor shall be your greatest common Measurer, which will divide both Numerator and Denominator, and reduce emboth into their lowest Terms at one Work.

emmon Measurer; to Effect which, I divide the Denominator 304 by the Numerator 228, and there remains 76, then I divide 228 (the fire Divisor) by 76 (the Remainder) and it quotes 3, and nothing remains; wherefore the last Divisor 76 is the common Measurer; by which I divide the Numerator of the given Fraction, viz. 228 it quotes 3 for a new Numerator, then I divide the Denominator 304 by 76, and it quotes 4 for a new Denominator, so that now I have found \(\frac{1}{2}\) equal to \(\frac{2}{3}\) \(\frac{1}{2}\).

5. Reduce \(\frac{6}{7}\frac{4}{9}\frac{8}{2}\) into its lowest Terms by a common Mea.

furer, Facit, -2.

6. Reduce 10 15 into its lowest Terms by a common Measurer, Facit, 15.

A Compendium.

Note, That if the Numerator or Denominator of a Fraction, end each with a Cypher or Cyphers, then cut off as many Cyphers from the one as from the other, and the remaining Figures will be a Fraction of the same Value, viz. $\frac{1+0}{7}$ will be found to be reduced to $\frac{1}{7}$, by cutting off the two Cyphers from the Numerator and Denominator with a Dash of the Pen thus, $\frac{3}{3}$ and $\frac{4}{7}$ will be $\frac{4}{7}$ thus, $\frac{46}{7}$ of $\frac{1}{7}$.

V. To find the Value of a Fraction in the known Parts of Coin, Weights, &c.

The Rule is, Multiply the Numerator by the Parts of the next inferiour Denomination that are equal to an Unit of the same Denomination with the Fraction; then divide that Product by the Denominator, and the Quote gives you its Value in the same Parts you multiply'd by, and if any Thing remain, multiply it by the Parts of the next inferiour Denomination, and divide as before; do so till you can bring it no lower, and the several Quotients, will give you the Value of the Fraction as was required: and if any at last remain, place it for a Numerator over the former Denominator. Some sew Examples will make the Rule plain.

P

and

1

either in Weight or Time, &c.

VI. To reduce a Compound Fration to a Simple of the same Value.

What a Compound Fraction is, hath been shewn in Chap.1. Definition 24, and to reduce it to a Simple Fraction of the fame Value.

The Rule is, Multiply the Numerators continually, and place the last Product for a new Numerator, then multiply the Denominators continually, and place the last Product for a new Denominator. So this fingle Fraction shall be equal to the compound Fraction. Example.

1. Reduce 1 of 1 of 1 to a simple Fraction.

Multiply the Numerators 2, 3, and 5 together, they make 30 for a new Numerator; then I multiply the Denominators 3, 5, and 8 together, and their Product is 120 for a Denominator, fo the simple Fraction is $\frac{10}{120}$, and cutting off the Cyphers, it is $\frac{3}{120}$ equal to $\frac{1}{4}$ by the 4th Rule following.

5	3
	2
	- (SEE
15	6
8	
	6 5
120	30

Facit 12, or 12, or 1.

Chap. 19.

2. What is 17 of 5 of 4 of 12? Answer 7540, or 7560 or 7777 in its lowest Terms.

3. What is 11 of 14 of 25? Answer 1003.

By this you may know how to find the Value of a compound Fraction, viz. First reduce it to a Simple one, and then find out his Value by the 5th Rule foregoing.

Example. 4. What is the Value of 1 of 5 of 2 of a

Pound? Answer 11 s. 3 d.

VII. To reduce Fractions of unequal Denominations to Fractions of the Same Value, having equal Denominators.

The Rule is, Multiply all the Denominators together, and the Product shall be the common Denominator. Then multiply each Numerator into all the Denominators, except its own, and the last Product put for a Numerator over the Denominator, found out as before: So this new Fraction is equal to that Fraction whose Numerator you multiply into the said Denominators. Do so by all the Numerators given, and you have your Desire.

Example.] 1. Reduce $\frac{3}{4}$ $\frac{4}{5}$ and $\frac{7}{4}$ to a common Denominator. Multiply the Denominators 4, 5, 6, and 8 together continually, and put the Products 960 for the common Denominator; then multiply the Numerator 3 into the Denominators 5, 6, and 8, and the Product is 720, which is a Numerator to 960 (found as before) fo $\frac{720}{550}$ is equal to the first Fraction $\frac{3}{4}$; then I proceed to find a

new

qr.

ame

f the

ultiply act for equal

V

t

be

th

Fr

new Numerator to the 2d Fraction, viz. 4, and I multiply 4 (into all the Donominators except its own, viz.) into 4, 6, and 8, which produceth 108 equal to 4, then multiply the Numerator 5 into the Denominators 4, 5, and 8, the Product is \$00 equal to 5. Then multiply the Numerator 7 into the Denominators 4, 5, and 6, the Product is 340 equal to 7, and the Work is done; fo that for 345 and 3, I have 730 668 800 and \$40.

2. Reduce 11, 14, and 19 in a common Denominator, fa-

ciunt, 37 36, 3726. and 5244.

VIII. To reduce a Fraction of one Denomination to another.

1. This either Ascending or Descending. Ascending when a Fraction of a smaller is brought to a greater Denomination; Descending, when a Fraction of a greater Deno-

mination is brought lower.

2. When a Fraction is to be brought from a leffer to a greater Denomination, then make of it a Compound Fraction, by comparing it with the intermediate Denominations between it, and that you would have it reduced to then (by the 6th Rule foregoing) reduce your Compound to a fingle Fraction, and the Work is done. Example.

Quest. 1. It is required to know what Part of a Pound

Sterling & of a Penny is?

To resolve this, I consider that I d. is 1 of a Shilling, and a Shilling is , of a Pound; wherefore ; d is f of ; of a of a Pound, which by the faid 6th Rule I find to be of a Pound Sterl. of English Money.

Quest. 2. What Part of a Pound Troy-weight is 4 of a Penny-weight? Answ. 4 of 10 of 12, equal to 1204. Troy.

3. When a Fraction is to be brought from a greater to a leffer Denomination, then multiply the Numerator by the Parts contained in the feveral Denominations betwixt it, and the Parts you would reduce it to; then place the last Product over the Denomination of the given Fraction. Exam,

Quest. 3. I would reduce ? 1. to the Fraction of 1 d. to do which, I multiply the Numerator 3 by 20 and 12, the Product is 720, which I put over the Denominator 5, it

makes 72 of I d. equal to

Queft. 4. What Fart of an Ounce Troy is 12? Answer, 10 07. CHAP.

CHAP. XX.

Addition of Vulgar Fractions.

1. If your Fractions to be added have a common Denominator, then add all the Numerators together and place their Sum for a Numerator to the common Denominator, which new Fraction is the Sum of all the given Fractions; and if it be improper, reduce it to a whole or mixt Number, by the 3d Rule in the 29th Chapter.

Quest. 1. What is the Sum of 24, 24, 14, and 14?

The Denominators are equal, viz. every one is 24, wherefore add the Numerators together, viz. 7, 9, 16, and 14, their Sum is 46, which put over the Denominator 24, it makes \$\frac{1}{4}\$ the Sum of the given Fractions, which will be reduced to the mixt Numbers \$1\frac{1}{24}\$, or \$1\frac{1}{12}\$.

2. But if the Fractions to be added have unequal Denominators, then reduce them to a common Denominator by the 7th Rule of Chapter 19. and then add the Numerators together, and put the Sum over the common Denominators together, and put the Sum over the common Denominators together.

tor, Sc. as before in the last Example.

Quest. 3. What is the Sum of 13, 11, and 16?

Answer. 127:55.

m.

. to

the

, it

mer, A P. 3. If you are to add mixt Numbers together, then add the Fractional Parts as before, and if their Sum be an improper Fraction, reduce it to a mixt Number, and add its integral Part to the integral Parts of the given mixt Numbers, and the Work is done.

Quest. 4. What is the Sum of 134 and 245?

First add the Fractions \(\frac{1}{4}\) and \(\frac{1}{8}\), the Sum is \(\frac{1}{4}\), then add the Integer 1 to 13 and 24, their Sum is 38, and put after it the Fraction \(\frac{1}{2}\) it is 3\(\frac{1}{2}\) for the Answer, or it is 38\(\frac{1}{2}\).

Quest. 5. What is the Sum of 487, 648, and 132?

Facit 243: 34, or 24345.

4. If any of the Fractions to be added, is a Compound Fraction, it must first be reduced to a Simple Fraction by

the fixth Rule of Chapter 19, and then add it to the rest, according to the second Rule of this Chapter. Example.

Quest. 6. What is the Sum of $\frac{1}{4}$, $\frac{1}{8}$ and $\frac{7}{8}$ of $\frac{1}{4}$ of $\frac{1}{8}$?

Reduce $\frac{7}{8}$ of $\frac{3}{4}$ of $\frac{3}{8}$ into a simple Fraction, and it is $\frac{1}{2}$, which reduced with the other two, and added, are $\frac{1}{2}$, $\frac{3}{7}$, $\frac{6}{8}$.

Quest. 7. What is the Sum of 1 and 3 of 4 of 5?

Answer. I- !.

5. If the Fractions to be added are not of one Denomination, they must be so reduced, and then proceed as before.

Quest. 8. What is the Sum of \$ 1. and & s.

Of the given Fractions here, one is of a Pound, and the other the Fraction of a Shilling; and before you can add them together, you must reduce $\frac{r}{8}$ s. to the Fraction of a Pound as the other is (by the 8th Rule of Chap. 19.) and it makes $\frac{r}{12}$ l, then $\frac{3}{4}$ and $\frac{r}{12}$ l will be found to be $\frac{3}{4}$ so l. or $\frac{3}{4}$ l. by the 7th Rule of Chap. 19. and in its lowest

Terms 15 1. by the 4th Rule of Chap. 19.

It would have been the same if (by the latter Part of the 8th Rule of Chapter 19.) you had reduced \(\frac{1}{4} \) l. to the Fraction of a Shilling \(\text{e} \) which you would have found to have been \(\frac{6}{4} \) s. which added to \(\frac{5}{5} \) s. by the said 17th Rule of the last Chapter, the Sum is 15 s. \(\frac{2}{4} \), which is equal to the Sum found, as before, \(viz. \) \(\frac{1}{2} \) l. for (by the 5th Rule of Chapter 19.) the Value of \(\frac{1}{2} \) l. will be found to be just as much.

Quest. 9. What is the Sum of \(^2 \) l. \(^2 \) s. and \(^2 \) Answ. \(^2 \) \(^2 \) or \(^2 \) \(^2 \) \(^2 \) or in its lowest Terms \(^2 \) \(^2 \) .

CHAP. XXI.

Subtraction of Vulgar Fractions.

Fractions to one Denomination, are here to be obferved; for before Subtraction can be made, the Fractions must be reduced to a common Denominator, then subtract one Numerator from the other, and place the Remainder oyer a common Denominator, which Fraction shall be the ExExcess or Difference between the given Fractions. Exam-

Quest. 1. What is the Difference between \(\frac{1}{4}\) and \(\frac{1}{4}\)? The given Fractions are reduced to \(\frac{1}{2}\), and \(\frac{1}{4}\), then subtract the Numerator 20 from the Numerator 21, and there remains 1, which being put over the Denominator 28, makes

for the Answer or Difference between 1 and 1.

Quest. 2. What is the Difference between \(\) and \(\frac{1}{4} \) Reduce the Compound Fraction \(\frac{1}{4} \) of \(\frac{1}{4} \) to a simple Fraction, then proceed as before, and the Answer is \(\frac{1}{44} \) equal to \(\frac{1}{4} \).

2. When a Fraction is given to be subtracted from a whole Number, subtract the Numerator from the Denominator, and put the Remainder for a Numerator to the given Denominator, and subtract an unite (for that you borrowed) for the whole Number, and the Remainder place before the Fraction found, as before, which mixed Number is the Remainder or Difference sought. Example.

Queft. 3. Subtract . 7 from 48.

he

ld

a

b

1.

ett

of

he

to

th

is

he

nd

H

ven

cb-

ons

ract

10-

the

Ex-

Answer. 37 -1; for if you subtract 7 (the Numerator) from 10 (the Denominator) there remains 3, which put over is 10 -1, and 1 (leborrowed) from 48 rests 47, to which join 13, and it makes 47 -1 for the Excess.

Quest. 4. Subtract 11 from 57, remain 56 -f.

Number, or one mixt Number from another, reduce the feetings to a common Denominator, and if the Fraction of the flubtracted be leffer than the other, then subtract the leffer Numerator from the greater, and that is a Numerator for the common Denominator; then subtract the leffer integral Part from the greater, and the Remainder with the remaining Fractions thereunto annexed, is the Difference required between the two given mixt Numbers. Example.

Queft. 5. Subtract 26 } from 54 }.

First, Subtract \(\frac{1}{7}\), viz. \(\frac{1}{41}\) from \(\frac{1}{7}\), viz. \(\frac{1}{42}\), the Remainder is \(\frac{1}{42}\), then 26 from 54, remaineth 28, to which

annex 18 it makes 28 48 for the Answer.

4. But if the Fraction to be subtracted is greater than the Fraction from whence you subtract, then having first reduced the Fractions to a common Denominator, take the Numerator of the greatest Fraction out of the Denominator,

H 2

and add the Remainder to the Numerator of the leffer Fraction, and their Sum is a new Numerator to the common Denominator, which Fraction Note, then (for the one you borrowed) add one to the integral part to be subtracted, and subtract it from the greater Number, and to the Remainder annex the Fraction you noted before, so this new mixt Number shall be the Difference sought. Example.

Queft. 6. Subtract 144 from 294.

The Fraction, reduced are, viq. $\frac{3}{4}$ equal to $\frac{1}{2}\frac{7}{8}$, and $\frac{4}{7}$ equal to $\frac{1}{2}\frac{6}{8}$, now I should subtract $\frac{2}{2}\frac{1}{8}$ from $\frac{16}{8}$, but I cannot, therefore I subtract 21 from 28, rest 7, which added to 16 (the lesser Numerator) make 23 for a Numerator to 28, viq. $\frac{2}{2}\frac{3}{8}$; then I come to the integral Parts 14 and 19, and say, I that I borrowed and 14 is 15. which taken from 29, there rests 14, to which annexing $\frac{2}{2}\frac{3}{8}$ it is $14\frac{2}{2}\frac{3}{8}$, for the Remainder or Difference between $14\frac{3}{4}$ and $29\frac{4}{7}$.

Queft. 7. Subtract 36, 2 from 744? Facit, 3749.

CHAP. XXII.

Multiplication of Vulgar Fractions.

I. I F the Multiplicand and Multiplier are simple Fractions, then multiply the Numerators together for a new Numerator, and the Denominators for a new Denominator, and the new Fraction is the Product required.

Quest. 1. What is the Product of 5 by 1? Facit 47, for the Numerators 5 and 9 being multiply'd, make 45, and the

Denominators 7 and 11 being multiply'd make 77.

Quest. 2. What is the Product of \$\frac{3}{27}\$ by \$\frac{2}{37}\$? Facit \$\frac{16}{29}\$?

2. If the Fractions to be multiplied be mixt Numbers, reduce them to improper Fractions by the first Rule of the 19th Chapter: then proceed as before.

Quest. 3. What is the Product of 28 by 135?

The given mixt Numbers being reduced to improper Fractions are 48? equal to 24?, and 13% equal to 13, now 24? multiplied by 13, according to the first Rule of this Chapter, produceth 13.29, or 67222.

Quest. 4. What is the Product of 430, 6 by 183? Facit

555 4, or 70374.

3. If a Compound Fraction is to be multiplied by a Simple

Quest. 5. What is the Product of 16 by 1 of 5 of 6? The Compound Fraction 1 of 7 of 4 reduced is 10, or which multiply by produceth 36 which in its low-

eft Term is 16 for the Answer.

And if the Multiplicand and Multiplier are both Combound Fractions, reduce them both to Simple ones, then multiply these new Fractions as before, so you have the Product.

Quest. 6. What is the Product of 1 of 1? of 1? Answer. 13 in its lowest Terms 20. Quel 7. What is the Product of ? of by ? of ??

Answer. 200, or in its least Terms ..

4. If a Fraction be to be multiplied by a whole Number, put under the given whole Number an Unit for a Denomitor, whereby it will be an improper Fraction, then multiply the Fraction as before, Example.

west. 8. What is the Product of 24 by ??

Answer. 48, for 24 by putting an Unit under it, will be 24, and 24 by. 2 produceth 4 3 or 16.

Quest. 9. What is the Product of 36 by 12?

Answer, 3 14 or 29-5.

CHAP. XXIII.

Divifun of Vulgar Fractions.

1. I F the Dividend and the Divilor are both simple Fractions, then multiply the Numerator of the Dadend into the Denominator of the Divisor, and the Product is a new Numerator, and multiply the Denominator of the Dividend into the Numerator of the Divisor, and the Product is a new Denominator, which new Fraction thus toused, " is the Quotient you defire. Example. Quest. 1. What is the Quotient of & divided by 34?

Anf. 25, or 1,4, for the first i multiply (5) the Numerator of the Dividend into (5) the Denominator of the Divisor,

and the Product (25) is a Numerator for the Quotient, then I multiply (8) the

$$\frac{3}{5}$$
 $\frac{5}{8}$ $\left(\frac{25}{24}\right)$ H 3 Des

Denominator of the Dividend, into (3) the Numerator of the Divisor, and the Product (24) I put in the Quotient for a Denominator, so I find 24 is the Quotient sought.

Queft. 2. What is the Quotient of 1° divided by 3?

Anfw. 30 equal to 5 in its lowest Terms.

2. But if you will divide a fimple Fraction by a Compound, or a Compound by a Simple, first reduce such Compound to a simple Fraction, then go on as before.

Quest. 3. What is the Quotient of 1 divided by 4 of ??

Answer. 3, or 3 first reduce 4 of 3 into a simple Fraction, and it is 12, by which 3 being divided, the Quotient is 36 equal in its least Terms to 16, and if the Dividend and Divisor be both of Compound Fractions, reduce them both to a simple Fraction, then divide the one by the other, as in Rule 1. foregoing.

Quest. 4. What is the Quote of \(\frac{2}{3}\) of \(\frac{1}{4}\) divided by \(\frac{1}{2}\) of \(\frac{1}{2}\).

Answer. \(\frac{1}{2}\)\(\frac{1}{2}\) or \(\frac{1}{2}\)\(\frac{1}{2}\), or \(\frac{1}{2}\)\(\frac{1}{2}\), or \(\frac{1}{2}\)\(\frac{1}{2}\).

3. If the Dividend, or Divisor, or both, are mixed Numbers, reduce them to improper Fractions, and perform Division as you are taught before.

Quest. 5. What is the Quote of 12 \(\frac{1}{4}\) divided by 21 \(\frac{4}{7}\)?

Answer. \(\frac{2}{3}\) \(\frac{1}{5}\) for 12 \(\frac{1}{4}\) is equal to \(\frac{1}{4}\), and \(\frac{2}{1}\) \(\frac{1}{4}\) is equal to \(\frac{1}{2}\), and the Quote of \(\frac{1}{4}\) divided by \(\frac{1}{2}\), is as before

416.

4. If you divide a Fraction by a whole Number, or a whole Number by a Fraction, make the whole Number an Improper Fraction, by putting an Unit for a Denominator to it, as was taught in Rule 4. Chap. 22. and then perform Division as was before taught.

Quest. 6. What is the Quote of 8 divided by 3?

Answer. $\frac{40}{3}$, which is equal to 13 1, being reduced as is before directed. See the Work in the Margent.

Quest. 7. What is the Quotient 8 3 4 40 40 40 40 40

of nt

t

d

CHAP XXIV.

The Rule of Three Direct in Vulgar Fractions.

I. A S in the Rule of Three in Whole Numbers, so likewise in Fractions, you must see that the Fractions of the first and third Places be of the same Denomination.

2. If any of the given Fractions be Compound, let them

be reduced to simple of the same Value.

3. If there are given mixed Numbers, reduce them to im-

proper Fractions by the first Rule of Chap. XIX.

4. If any of the three Terms is a whole Number, make it an improper Fraction by constituting an Unit for its Denominator.

Having reduced your Fraction as is directed in the 4 last Rules, then proceed to a Resolution, which is performed the same Way as in whole Numbers, Respect being had to the Rules delivered for the working of Fractions, viz. Multiply the 2d and 3d Fractions together, according to the the first Rule of Chap. XXII. and divide the Product by the first Fraction, according to the first Rule of Chap. XXIII. and the Quotient is the Answer.

(Or, (which is better)

5. Multiply the Numerator of the first Fraction into the Denominator of the second and third, and the Product is a ew Denominator; then multiply the Denominator of the first Fraction into the Numerator of the 2d and 3d, and the Product is a new Numerator, which new Fraction is the 4th Proportional or Answer, which (if it be an improper Fraction) must be reduced to a whole or mixed Number by the 3d Rule of Chap. XIX. Example,

Quest. 1. If 3 Yards of Cloth cost & 1. what will - Yds

coft?

Having placed the given Fractions according to the 6th Rule of Chap. X. I proceed to the Resolution, and first I multiply the Numerator of the first Fraction (3) into 8 and 10, the Denominators of the second and third Fractions, and the Product is 240 for a Denominator; then H 4

Answer. 35 l.

Quest. 13. If 14 1. of Gold is worth 61 - 1. Sterling, what is a Grain worth at that rate?

Answer. 11d.

Quest. 14, If 3 Yards of Silk is worth 3 of 5 1. what is the Price of 153 Ells Flemish?

Anjwer. 9 1. 125.6 d.

Quest. 15. If \(\frac{2}{3}\) of \(\frac{2}{3}\) of a Pound of Cloves cost 6 s. 2\(\frac{2}{3}\) dwhat cost the C. weight at that rate?

Answer. 69 1. 6 s. 8 d.

Note, That when the Answer to the Question in this and the next Chapter are given in Fractions, they are given in their lowest Terms.

CHAP. XXV.

The Rule of Three Inverse in Fractions.

I. I Thath been already taught (in the 3d Rule of the 11th Chapter) how to discover when the 4th proportional Number (to the three given Numbers) is to be found out by a Rule of Three In-

verse; to which Rule the Learner is now referred.

2. When (in Fractions) you find a Question to be solved by the Rule of Ibree Inverse, viz. when the third Term is the Divisor, then having reduced the Terms exactly (according to the Rules in Chap. 24.) multiply the Numerators of the three Fractions into the Denominators of the 2d and 1st Fractions, and the Product is a new Denominator; then multiply the Denominator of the 3d Fraction into the Numerators of the 2d and 1st Fractions, and the Product is a new Numerator, which new Fraction thus found, is the Answer to the Question.

HS

154 The Rule of Three, &cc. Chap. 25.

Quest. 1. If \(\frac{3}{4}\) of a Yard of Cloth that is two Yards wide, will make a Garment, how much of any other Drapery that is \(\frac{3}{5}\) of a Yard wide will make the same Garment?

Answer. 2! Yards.

Quest. 2. I lent my Friend 46 l. for 3 of a Year, how much ought he to lend me for 17 Farts of a Year?

Answer. 63? 1.

Quest. 3. It 3 of a Yard of Cloth that is 23 Yards wide will make any Garment, what Breadth is that Cloth when 1 3 Yard will make the same Garment?

Answer. 65 of a Yard wide.

Quest. 4. How many Inches in Length of a Board that is 9 Inches broad, will make a Foot Square?

Answer. 16 Inches in Length.

Quest. 5. If when the Buthel of Wheat cost 4 s. \frac{3}{4}. the Penny-loaf weighed 10 \frac{3}{5} Ounces, what will it weigh when the Bushel cost 8 s. \tau^2?

Answer. 5 185 Ounces.

Quest. 6. If 17 Men can mow 24 1 Acres in 10 2 Days, in how many Days will fix Men do the same?

Answer. In 21 ; Days.

CHAP. XXVI.

Rules of Practice.

1. IN the fingle Rule of Three, when the first of the 3 Numbers in the Question (after they are disposed according to the fixth Rule of Chapter 10,) happeneth to be an Unit (or 1) that Question many Times may be resolved far more speedily than by the Rule of Three, which kind of Operation is commonly called *Practice*, and indeed it is of excellent Use among Merchants, Tradesmen, and others, by reason of its Speediness in finding a Resolution to such Kind of Questions.

2. The chiefest Questions resolvable by these brief Rules, may be comprehended under the three general Heads or

Cales following, viz.

50

I

li

I

Ī

1

When the given Price of the Integer confids

n

is

d

to

1

ch

d

ac

:5,

or

CR

1 Of Farthings under 4. 2 Of Pence under 12.

3 Of Pence and Farthings.

4 Of Shillings under 20.

5 Of Shillings, Pence, and Farthings.

6 Of Pounds.

7 Of Pounds, Shillings, Pence, and Farthings.

It would be very convenient for the Practical Arithmetician to have by Heart the feveral Products of the 9 Digits multiplied by 12, for bis speedy reducing Pence into Shillings, and Shillings into Pence, which he may gain by the following Table.

12 Times 5 is 60 72 84 96 93 108

3. Shillings are practically reduced into Pounds thus, viz. Cut off the Figure standing in the Place of Units with a Dash of the Pen, and note it for Shillings, then draw a Line under the given Number, and take half the remaining Figures (after the first is cut off) and set them under the Line, and they are so many

Pounds; but if the last Figure is odd, 4365 then take the lesser half and add 10 to the Figure so cut off (as before) for Shil-

lings; as if I were to reduce 43658 Shil- 2182

lings into Pounds, first I cut off the last
Figure (8) for Shillings, then I take half of the remaining
Figures (4365) thus, half of 4 is 2, which I put under the
Line, then half of 3 is 1, and because 3 is an odd Number,
I make the next Figure 6 to be 16, and I go on, saying, half
of 16 is 8, then half of 5 is 2, which is the last Figure,
wherefore because 4 is an odd Number, I add 10 to the 8 I
cut off, and it makes 18 s. so that I find it to be 2182 s.
18 s. as per Margent.

18

4. It is likewise convenient that the Learner be acquainted with the Practical Tables following the first containing the Aliquot or even Parts of a Shilling, the 2d containing the Aliquot Parts of a Pound.

5. When the Price of an Integer is a Farthing, then take the 6th part of the given Number, which will be so many Three-half-pences, and if any Thing remains it is Farthings by the 7th Rule of Chap. 9. then consider that Three-half-pence is \(\frac{1}{3} \) of a Shilling, wherefore take the 8th Part of them for Shillings, and if any thing remain, they are so many Three-half-pences, which reduce into Pounds by the third Rule foregoing. Example, What comes 67486 \(l. \) to, at a Farthing per \(l. \)? First, I take \(\frac{1}{3} \) of 67486, and it it 11247 Three-half pences and sour Farthings, or 1 Penny, then \(\frac{1}{3} \) of 11247 is 1405 \(s. \) and seven remains, which is seven Three-half-pences, or 10 \(\frac{1}{3} \) d. which, with the four Farthings before, make 11\(\frac{1}{3} \) d. and 1405 \(s. \) which by the third Rule is 70 \(l. \) 5 \(s. \) In all 70 \(l. \) 5 \(s. \) 11 \(d. \) for the Answer. See the Work following.

1	6	67486 at 4 per l.

8. When the given Price of the Integer, is a Part or Parts of a Shilling, (viz. Pence) divide the given Number of Integers, (whose Value is sought) by the Denominator of the Fraction representing the even Part, and the Quote is Shillings (always minding the 7th Rule

Rule of the 9th Chapter) and those Shillings may be reduced into Pounds by the third Rule of this Chapter, Example: Let it be required to find the Value of 438 l. at 3 d. per l. I consider 3 d. is \frac{1}{4} of a Shilling, and 438 l. will cost so many 3 Pences, wherefore I divide 438 by 4 the Denominator or \frac{1}{4}, and the Quote is 109 Shillings, and two remains, which is two 3 d. or 6 d. the whole Value is 5 l. 9 s. 6 d. as by the following Work appeareth.

438 l. at 3 d.

1. s. d. Facit 5 9 6

If the Learner is minded to try the Fruitfulness of his Genius, he may frame as many Examples as he thinks fit, and work them as before.

9. If the Price of the Integer be Pence under 12, and yet not an even Part, then it may be divided into even Parts, and so the Parts of the given Numbers taken accordingly, and added together, as if it were 5 d. which is 3 d. and 2 d. viz. + and ; of a Shilling, first take + of the given Number, and then thereof, and add them together, and their Sum is the Answer in Shillings, still obferving Rule 7 of Chapter 9, for the Remainder, (if any be) then bring the Shillings into Pounds by the third Rule foregoing. Likewise 7 d. is $\frac{1}{3}$ and $\frac{1}{4}$, to 9 d. is $\frac{1}{4}$ and $\frac{1}{4}$, and 10 d. is $\frac{1}{2}$ and $\frac{1}{3}$, and 11 d. is $\frac{1}{4}$ and $\frac{2}{3}$ of a Shilling; or else many Times your Work may be shortned thus. viz. when the faid given Price is to be divided into even Parts of a Shilling, or of a Pound, after you have taken the first even Part, the other may be an even Part of that Part, as in the next Example, where are given 439 l. at 5 d. per l. now I may divide it thus, viz. into 4 d. and 1 d. and 4 d. being of a Shilling, and I d. being 1 of 4 d. I first take 1 of 439 1. and it gives 146 s. 4 d. and for the 1 d. I take 1 of 146 s. 4 d. which is 36 s. 7 d. which in all comes to 9 1. 25. 11 d. Examples follow.

Penny, and therefore I take $\frac{1}{4}$ of 280 s. 2 d. which is 72 s. 3 d. 2 qrs. and add them together, and they are 18 l. 1 s. 5 d. 2 qrs. as by the Margent.

ceive that one Farthing is the \(\frac{1}{4}\) of a Penny, and the Value of one Far-

thing will be + of the Value of a

Case 4.

11. When the Price of the Integer is 2 s. then cut off the Figure in the Place of Units of the given Number, and double it for Shillings, and the Figures on the other Hand are Pounds. Example, 436 Yards at 2 s. per Yard, cut off the last Figure 6, and double it, makes 43 15 12 s. and the other two Figures, viz 43, are so

many Pounds; so that their Value is 43 l. 12 s. 43l. 12s. as per Margent.

12. Hence it is evident that when the given Price of an Integer is an even Number of Shillings, then if you take half of that (even) Number of Shillings, and multiply the given Number of Integers thereby, doubling the first Figure of the Product, and setting it apart for Shillings, the rest of the Product will be Pounds, which Pounds and Shillings are the Value sought. Example. What cost 536 Yards at 8 s. per Yard? To resolve which, I take Half of 8 s. (the Price of a Yard) which is 4, and multiply 536 thereby, saying, 4 Times 6 is

24, then I double the first Figure 4 makes 8
for Shillings, and carry 2 to the next Product, &c. I find the rest of the Product to be
2141.8 s.
214, which I note for Pounds; so that the

Value of 536 Yards at 8 s. per Yard, is 214 l. 8 s. as by the Margent. Other Examples of the same Kind may be wrought after the same Manner.

13. If the given Price of the Integer is an odd Number of Shillings, then work first for the even Number

of Shillings by the last Rule, and for the odd Shilling take 10 of the given Number of Integers, according to the 3d Rule of this Chapter, and add them together, and you have your Defire. Examples follow.

Example.

e

n-

er

of

109 l. Facit

Cafe 5.

15. When the given Price of an Integer is Shillings and Pence, or Shillings, Pence and Farthings; then diride the given Number of Integers whose Value you tek by the Denominator of that Fraction representing hat even Part. As for Example, What is the Price of 184 yards at 6 s. 8 d. per yard? Here I confider that 6 s. s. is of a Pound, wherefore divide 384 by 3, and he Quote is the Answer, viz. 128 l. o that 384 yards at 6 s 8 d. per yard,

mounts to 128 1. as per Margent, still ob tiving the 7th Rule of the 9th Chapter.

16. When the given Value of the Integer is Shillings

and Pence, and not an even Part of a Pound, yet many times it may be divided into Parts (viz. 6 s. 6 d. is 4 s. and 2 s. 6 d.) for the 4 s. Work according to the 12th Rule foregoing, and for the 2 s. 6 d. take the eighth Part of the given Number, and add them together, then their Sum is the Value required.

So 8 s. 6 d. will be divided into 6 s. and 2 s. 6 d. and the the Price of the given Number may be found out as before,

&c. Examples follow.

Danispies tonow.	
386 at 8 8	Ells s. d. s. 240 at 5 4

17. When the given Price of an Integer is Shillings a Pence, and you cannot readily divide them according to the last Rule, then multiply the given Number whose Va lue you feek, by the Number of Shillings in the Price of the Integer, and then for the Pence work by the 8 Rule foregoing; then add the Numbers together, and the Sum is their Value fought in Shillings; as for Example What is the Value of 392 Yards at 6 s. 9 d. per Yar Here 6 s. o d. cannot be made an even Part, nor inde can it be divided into even Parts of a Pound; wherefore multiply the given Number of Yards 392 by 6 for the 6 the Product is 2352 s. then for the 9 d. I divide it in 6 d. and 3 d. and work for them by the 8th Rule foregoing and at last add the Shillings together, they make 2646 and by the 3d they are reduced to 132 1.6 s. the Value 392 yards at 6 s. 9 d. per yard. See the Work,

first take the Half of the given Value, and then Half of the Half, fetting each Part under the Precedent, then adding them together, their Sum will be the required Value of the Integers and their Parts. Example, What is the Value of 116 Yards, at 4 s. 6 d. per Yard ? To give an An. fwer, First I work for the Value of 116 Yards, by the 5th yds. d. -Rule foregoing, and then for the 116: at 4 half Yards, I take half of 4 s. 6 d. which is 2 s. 3 d. and add to the 111. 125. 2 5. rest found as before, then is that 14%. 10d. | 2 s. 6d. Sum the total Value of 116! vrds 2 3 | 1 yards. at 4 s 6 d. per Yard, which I find to amount to 26 l. 4 s 3 d. as by 26 4 3 Facit the Work in the Margent. And all other Examples of this Kind, are wrought the fame Way.

Many more Questions may be stated, and several other Rules of Practice may be shewn according to the Methods of diverse Authors; but what have been delivered here, are sufficient for the Practical Arithmetician in all Case

whatfoever.

C H A P. XXVII.

The Rule of Barter.

I. DArter is a Rule among Merchants, which (in the D Exchange of one Commodity for another) informs them so to proportion their Races, as that neither may fuftain Lofs.

2. To refolve Questions in Barrer, will not be difficult to him that is acquainted with the Golden Rule, or Rule of Three, it being altogether used in resolving such flone

Questions.

Queft. 1. Two Merchants, (viz. A and B) Barter, A hath 13 C. 3 grs. 14 l. of Pepper, at 2 l. 16 s. per C. and B hath Cotton at 9 d. per l. I demand how much B mul give A for his Pepper?

Answer. 9 C. 1 gr.

First find by the Rule of Three, or the Rules of Pradice foregoing, how much the Pepper is worth, faying

"If 1 C. coft 21. 16 s. what will 13 C. 3 grs. 141. coft ? Anlwer. 38 1. 17 s.

Secondly, By the Rule of Three, fay, If 9 d. buy 1 l. of

Cotton, how much will 38 1. 17 s. buy?

Answer. 9 . C. and so much Cotton must B give to Afor 13 C. 3 grs. 14 l. of Pepper, at 2 l. 16 s. per Cent. when the

Cotton is worth 9 d. per l.

Quest. 2. A and B Barter, A hath 120 Yards of broad Cloth, worth 6 s. per Yard, but in the Barter he will have 8 s. per Yard; B hath Shalloon worth 4 s. per Yard. Now I demand how many Yards of Shalloon B must give A for his Broad-cloth, making his Gain in Barter equal to that of A? Answer, 110 Yards of Shalloon.

First (as in the last Question) find out how B ought to fell his Shalloon in Barter, viz. fay, If 6 s. require 8 s. what

will 4 s. require?

l.

s.

ne

er di

re,

Ses.

the

rms

may

liffi-

ying

An wer. 55. 4d.

Thus you fee that B must fell his Shalloon in Barter at

s. 4 d. if A fell his Broad-cloth at 8 s. per Yard.

It remaineth now to find out how much Shalloon B must give for 120 Yards of Broad-cloth, which resolved after the Method in the first Question of this Chapter is found to be 180, and so many Yards of Shalloon must B give A for the 100 Yards of Broad-cloth.

Quest. 3. A and B bartered, A had 14 C. of Sugar worth d. per 1. for which B gave him 1 C. 3 grs. of Cinnamon, I

demand how B rated his Cinnamon per I.

Answer. 4 s. per 1.

Quest. 4. A and B Barter, A hath 4 Tun of Brandy, worth 71. 16 s. ready Money, but in Barter he hath 50 1. 2s. per Fun, and giveth B 21 C. 2 grs, 11 & l. of Ginger for the 4 Tun of Brandy, I defire to know how much B fold his Ginof er in Ba er in Barter per C. and how much it was worth in ready

Answer. For 9 1. 6 s. 8 d. in Barter, and it is worth 7 1.

r Cent. in ready Money.

Quest. 5. Aand B Parter, A hath 320 Dozen of Candles. 4s. 6 d. per Dozen, for which B giveth him 30 l. in Mesy, and the rest in Cotton at 8 d. per L I demand how uch Cotton he must give him more than 30 1.

Pri- Answer, 11 C. 1 gr.

CHAP. XXVIII.

Questions in Loss and Gain.

Merchant bought 436 Yards Broad-cloth for 8 s. 6 d. per Yard, and selleth it again at 10 s. 4d. per Yard; now I defire to know how much he gained in the 436 Yards?

Answer. 39 l. 12 s. 4 d.

First, Find out by the Rule of Three, or by Practice how much the Cloth coft him at 8 s. 6 d. per Yard, which I find to be 185 1.6 s, then by the same Rule find out how much he fold it for, viz. 225 l. 5 s. 4 d. then fubtract 1851 6 s. which it cost him, for 225 l. 5 s. 4 d. which he fold it for, and there remaineth 39 1. 19s. 4 d. for his Gain in the Sale thereof.

Otherwise, it may sooner be resolved thus, first find on how much he gain'd per Yard, viz. Substract 8 s. 6 d. which he gave per Yard, from 10 s. 4 d. which he fold it for pe Yard, the Remainder is 1 s. 10 d. for his Gain per Yard

Then fay,

If one Yard gain 1 s. 10 d. what will 436 Yards gain The Answer, by Practice or the Rule of Three, is 39 19 s. 4 d. as was found before.

Quest. 2. A Draper bought 124 Yards of Holland-cloth which he gave 31 l. I defire to know how he must fell it pe Yard to gain 10 1.6 s. 8 d. in the whole Sale of 124 Yards

Answer. At 6 s. 8 d. per Yard.

Add the Price which it cost him, (viz. 31 1.) to his in tended Gain, (viz. 10 1. 6 s. 8 d.) the Sum is 41 1. 6 s. 81 dred Then fay, C. W

If 124 Yards require 41 l. 6 s. 8 d. what will 1 Yd m quire? By the Rule of Three, I find the Answer 6 s. 8 d.

heins Quest. 3. A Grocer bought 3 C. 1 gr. 14 l. of Clove the which cost him 2 s. 4 d. per l. and fold them for 52 l. 14 muc I defire to know how much he gained in the Whole? lon t

Anfwer. 8 1. 12 s.

Queft. 4. A Draper bought 86 Kerfeys for 129 1 1d 4 mand how he must fell them per Piece to gain 15 1. in lass ing out 100 l. at that rate? Answer. 1 l. 14 s. 6 d. ploo Piece; for,

As 100 is to 115 l. fo is 129 l. to 148 l. 7 s.

So that by the Proportion above, I have found how much he must receive for the 86 Kerseys, to gain after the Rate of 15 per C. Then to find how he must fell them per Piece, I fay,

As 86 Pieces are to 148 1. 7 s. fo is one Piece to 1 1. 4s.

6 d. which is the Number fought.

Queft. 5. A Grocer bought 41 C. of Pepper for 15 1. 17 s. 4 d. and it proving to be damnified) is willing to lose 12 1. 10 s per Cent. I demand how he must sell it per 1?

Answer. 7 d. per l.

8 5.

4 d.

tice,

how

hisin

Subtract 12 l. 10 s the Loss of 100 l. from 100 l.

and there remains 87 1. 10 s. Then fay,

As 100 l. is to 87 l. 10 s. fo is 15 l. 17 s. 4 d. to 13 1. 17 s. 8 d. and to much he must fell it all for, to lose after the Rate propounded: Then to know how he must fell ie per l. I fay,

As 13 1. 17 s. 6 d. is to 4 . C. fo is 1 1. to 7 d.

hich Queft. 6. A Plummer fold 10 Fodder of Lead (the Fodder containing 19 1 C) for 204 l. 10 s. and gained ard after the Rate of 12 1. 10 s per 100 1. I demand how much it coft him per C? ain

Anfwer. 18 s. 8 d.

To resolve this Question, add 12 1. 10 s. (the Gain per Cent.) to 10 1. and it makes 112 1. 10 s. Then fay,

As 112 1. 10 s. is to 100 1. fo is 204 1. 15 s. to 182 1. it po Which 182 1, is the Sum it cost him in all; then reduce your 10 Fodders to Half Hundreds, and it makes 390. Then fay,

s. 84 As 390 Half Hundreds is to 1821. fo is 2 Half Hundreds to 18 s. 8 d. the Price of two Half Hundreds, or I

Yd me. and fo much ic flood him in per C. wt

Quest. 7. A Merchant bought eight Tuns of Wine, which 2 Quest. 7. A Merchant bought control and loseth after clove being sophisticated, he selleth for 400 l. and loseth after love being sophisticated, he selleth for 400 l. Now I demand how the selleth is per Gallon to lofe after the faid Rate ?

Id Answer. It coft him 56 1. per Tun, and he muft fell it se in lass 11 d ig grs. per Gallon, to lose 12 /. in receiving

d. 100 %

TV

To resolve this Question, I consider in the first Place, that in receiving 100 l. he loseth 12 l. therefore 100 l. comes in for 112 l. laid out; wherefore to find out how much he laid out for the whole, I say,

As 100 l. is to 112 l. fo is 400 l. to 448 l. and fo much the 8 Tuns coft him : Then to find how much it coft

per Tun, I say,

As 8 is to 448 l. fo is 1 to 56 l. the Price it coft per

Now to find how he must sell it per Gallon, reduce the

8 Tuns into Gallons, make 2016. Then fay,

As 2016 Gallons is to 400 l. fo is 1 Gallon to 3 s. 11 d. 2 10 qrs. the Price he must sell it at per Gallon to lose as aforetaid.

Quest. 8. A Merchant bought 8 Tuns of Wine, which being sophisticated, he is willing to sell for 400 l. and loseth at that Rate 12 l. in laying out 100 l. upon the same; now I demand how much it cost him per Tun?

Here I confider that for 100 l. laid out, he received but \$8.1. wherefore to find what 8 Tuns cost him, I say,

As 88.1. is to 100 l. fo is 400 l. to 454 - the Price it all cost him; then to find how much per Tun, I say,

As 8 is to 454 -6, fo is 1 to 56 -7, or 56 1. 16 s. 4 d.

CHAP. XXIX.

Equation of Payments.

E Quation of Payments is that Rule among Merchants, whereby we reduce the Times for Payment of feveral Sums of Money to an equated Time for Payment of the whole Debt, without Damage to Debtor or Creditor; and

The Rule is.

2. Multiply the Sums of each particular Payment by its respective Time, then add the several Products together, and their Sum divide by the total Debt, and the Quotient thence arising is the equated Time, for the Payment of the whole Debt. Example.

Queft.

Quest. I. A is indebted to B in the Sum of 130 l. whereof 50 l. is to be paid at 2 Months, and 50 l. at 4 Months,
and the rest at 6 Months, now they agree to make one
Payment of the total Sum; the Question is, What is the
equated Time for Payment, without Damage to Debtor
or Creditor?

To resolve this Question, I multiply each Payment by

er lies Time, viz.

he

to

ch lo-

e;

JUC

e it

d.

ayfor

by

Pay-

ueft.

501. Multiply'd by 2 Mon. produceth-100
301. Multiply'd by 4 Mon. produceth-200
301. Multiply'd by 6 Mon. produceth-180

The Sum of the Products is-480

Then I divide 480 (the Sum of the Products) by 130 (the total Debt) and the Quotient is 3 12 Months for the

Time of paying the whole Debt.

Quest. 2. A Merchant hath owing him 1000 l. to be paid as schloweth, viz. 600 l. at 4 Months, 200 l. at 5 Months, and the rest (which is 200 l.) at 12 Months, and he agreeth with the Debtor to make one Payment of the whole, I demand the Time of Payment without Damage to Debtor or Creditor?

The Sum of the Products is —6000 and the Sum of the Products (6000) being divided by the whole Debt (10001) quotes 6 Months for the Time of Payment of the whole Debt

3. The Truth of the Rule is thus manifest, if the Interest of that Money which is paid by the e-

quated Time (after it is due, he equal to the Proof of the Interest of that Money (which by the equated Time) is paid so much sooner than the Equation of it is due at any rate per C. then the Operation is true, otherwise not. Example.

In the last Queilion 600 l. should have been paid at 4 Months, but is not discharged till 6 Months, (that is 2 Months after it is all due) wherefore its Interest of 2 Months at 6 per Cent. per Annum is 6 l. and then 200 l.

I 2

was to be paid at 6 Months, which is the equated Time for its Payment, therefore no Interest is reckoned for it; but 200 l. should have been paid at 12 Months. but is paid at 6 Months, which is 6 Months sooner than it ought, wherefore the Interest of 200 l. for 6 Months is 6 l. (accounting 6 l. per Cent. per Annum) which is equal to the interest of 600 l. for 2 Months, wherefore the Work is right.

Quest. 3. A Merchant hath owing him a certain Sum to be discharged at 3 equal Payments, viz. $\frac{1}{2}$ at two Months $\frac{1}{3}$ at four Months, and $\frac{1}{3}$ at eight Months, the Question is, What is the equated Time for the Payment of the whole Debt?

In Questions of this Nature, (viz. where the Debt is divided into unequal Parts) each of its Parts is to be multiply'd by its Time, and the Sum of the Product is the Answer.

multiply'd by 2 Mon. produceth \(\frac{7}{3}\)
multiply'd by 4 Mon. produceth 1 \(\frac{7}{3}\)
multiply'd by 8 Mon. produceth 2 \(\frac{7}{4}\)

The Sum of the Product is 4 \frac{2}{3} which is 4 \frac{2}{3} Months for the equated Time of Payment.

If instead of the Fractiors representing the Parts, you had wrought by the Numbers themselves (represented by those Parts) according to the first and second Example, it would have been the same Answer; and suppose the Debt had been 90 L then \(\frac{1}{2}\) of it is 30 L for each Payment, viz. at 2, 4, and 8 Months. Then,

30 l. multiply'd by 2 Mon. produceth 60 30 l. multiply'd by 4 Mon. produceth 120 20 l. multiply'd by 8 Mon. produceth 240

The Sum of the Product is 420 which divided by 90 (the whole Debt) quoteth 4 50, or 4 5 Months as before.

Quest. 4. A Merchant oweth a Sum of Money to be paid \(\frac{1}{2} \) at 5 Months, and \(\frac{1}{2} \) at 8 Months, and \(\frac{1}{2} \) at 10 Months, and he agreeth with his Creditor to make one to-stal Payment; I demand the Time without Damage to Deb-

Queft. 4. A is indebted to B 640 1. whereof he is-to pay 40 l. present Money, 350 l. at 3 Months, and the rest, (viz. 250 l. at 8 Months, and they agree to make an equated Time for the whole Payment, now I demand the. Time?

In Questions of this Nature, (viz: where there is ready. Money paid) you are multiplying to neglect the Money that is to be paid present, and work with the rest, as is before directed, and divide the Sum of the Products by the whole Debt, and the Quote is the Answer; for here 40 1, is to be paid present, and hath no Time allowed; and according to the Rule it should be multiplied by its Time, which is 0; therefore 40 Times 0 is 0, which neither augmenteth nor diminisheth the Dividend; wherefore to proceed. (according to Direction) I fay,

350 by 3 Months, produceth _____ 1050 250 by 8 Months, produceth ---- 2010

The Sum of the Product is 3050 which divided by 640, the whole Debt; the Quote is 440 Months, the Time of Payment.

Quest. 6. A is indebted to B in a certain Sum half whereof is to be paid present Money, one 3d at 6 Months, and the rest at 8 Months; now I demand the equated Time for Payment of it all?

Answ. 3 1 Months is the Time of Payment.

Quest. 7. A is indebted to B 120 1. whereof ; is to be paid at 3 Months, 1 at 6 Months, and the rest at 9 Months :. What is the equated Time for the Payment of the whole Sum?

Answ. At 6 Months ?

Quest. 8. A is indebted to B 420 1. which is due at the End of 6 Months, but A is willing to pay him 140 L prefent, provided he can have the Remainder forborn fo much the longer, to make Satisfaction for his Kindness; which is agreed upon: I defire to know what Time ought to be allotted for the Payment of the 280 1, remaining?

the

Dy

The Operation of this Question is left to the Learner, to try his Genius; and who, in this Case, must have an Eye to the Rule of Three.

CHAP. XXX. EXCHANGE.

I. THE Rule of Exchange informeth Merchants how to exchange Monies, Weights, or Measures of one Country into (or for) the Monies, Weights, or Measures of another Country, and when the Rate, Reason, or Proportion betwixt the Money, Weights or Measures of different Countries is known, it will not be difficult for the Practitioner that is well acquainted with the Rule of Proportion (or Rule of Three) to resolve any Question, wherein it is required to exchange a given Quantity of the one Kind into the same Value of another Kind.

2. In Questions of Exchange there is always a Comparifon made between the Coins, &c. of two Countries (or

Kinds) or of more.

3. In Questions where there is a Comparison made between two Things, (whether they be Monies, Weights, Sc.) of different Kinds, there may be a Solution found by a fingle Rule of Three, as by the following Example.

Quest, 1. A Merchant at London delivered 370 1. Sterl. to receive the same at Paris in French Crowns; the Exchange 3 1 French Crewns per 1. Sterling, I demand how

many French Crowns he ought to receive?

In placing the Numbers, observe the 6th Rule of the 11th Chapter, which being done, the given Number will stand thus:

l. Crowns l.

and being reduced according to the Rules of the 12th Chapter, will stand thus:

As is to 3, so is 370 to 1233 i.

So that I conclude he ought to receive 1233 is French
Crowns at Paris for his 370 l. delivered at London.

Quest. 2. A Merchant delivered at Amsterdam 587 L. Flemish, to receive the Value thereof at Naples in Ducats,

Chep. 30. Exchange.

the exchange 4\frac{4}{7} Ducats per l. Flemish. I demand how many Ducats he ought to receive?

The Proportion is as followeth.

l. Ducats.

As 1 is to \(^2\frac{4}{7}\), so is \(^5\frac{3}{7}\) to 28 17 \(^2\frac{3}{7}\).

So I find he ought to receive 2817 | Ducats at Naples

for the 387 1. Flemish delivered at Amsterdam.

Quest. 3. A Merchant at Florence delivereth 2478 Ducatoons, to receive the Value at London in Pence, the Exchange at 53 \(\frac{1}{2}\) Sterl. per Ducatoon; I demand how much Sterling he ought to receive?

The Proportion for Refolution is,

Duc. d. Duc. d.

As + is to 1°2, so is 3478 to 186073.

which is equal to 775 1. 6 for the Answer.

4. When there is a Comparison made between more than two different Coins, Weights, or Measures, there ariseth ordinarily two different Cases from such a Comparison.

the first Coin, Weight or Measure, are equal in Value to a known Number of Pieces of the last Coin, Weight or Measure.

2. When it is required to find out how many Pieces of the last Coin, Weight, or Measure, are equal in Value to a given Number of the first fort of Coin, Weight, or Measure.

An Example of the first Case may be this, viz.

Quest. 4. If 150 Pence at London are equal to 3 Ducats at Naples, and 4 \$ Ducats at Naples make 34 ! Shillings at Brussels; then how many Pence at London are equal to 139 s. at Brussels? Facit, 960 d.

The Question may be resolved by two single Rules of

Three: For first, I say,

If ? Ducats at Naples make 150 d. at London, how

many Pence will 3 & Ducats make? Answ. 240 d.

By the foregoing Proportion we have discovered that 4 Ducats at Naples make 240 Pence at London; and by the Tenor of the Question we see that 4 Ducats at Venice make 35 \frac{1}{2} Shillings at Brussels, therefore 240 d. at London are equal to 34 \frac{1}{2} s. at Brussels, (for the Things-that are

the

and

Div

fing

rep

Na

Shi

fla

ti

are equal to one and the fame Thing, are also equal to one another) wherefore we have a Way laid open to give a Solution to this Question by another Single Rule of Three, whose Proportion is,

As 34 - s. at Bruffels is to 240 d. at London, fo is 131 s. at Bruffels to 960 d. at London; which is the Answer to

the Question.

An Example of the fecond Cafe may be this, viz.

Queft. 4. If 40 l. Averdupois-weight at London is equal to 36 1. Weight at Amsterdam, and 90 1. at Amsterdam makes 116 l. at Dantzick, then how many Pounds at Dantzick, are equal to 122 l. Averdupcis-weight at London? Answer, 129 27 le at Dantzick.

This Question is likewise answered by two single Rules of

Three viz. First, I say,

As 36 l. at Amsterdam is to 46 l. at London. So is 50 l. at Amsterdam to 100 l. at London.

And by the Question you find that 90 1. at Amsterdam. is 116 l. at Dantzick; and therefore 100 at London is like wife equal thereunto; wherefore again I fay,

As 100 l. at London is to 116 l. at Dantzick. So is 112 l. at London to 129 2 l. at Dantzick.

Bywhich I find that 129 17 1. at Dantzick are equal to

112 Averdupois-weight at London.

5. There is a more speedy Way to resolve such Questions as are contained under the two Cases before-mention'd, laid down by Mr. Kerfey in the d Chapter of his Appendix to Wingate's Arithmetick, where he hath given two Rules for the Resolution of the Questions pertinent to the two faid Cafes.

6. But I shall lay down a general Rule for the Solution of both Cases; and 1st, Let the Learner observe the following Directions in placing of the given Terms, viz.

7. Let there be made two Columns, and in these Columns so place the given Terms one over the other, as that in the fame Column there may not be found two Terms of . the same Kind one with the other,

Having thus placed the Terms, the general Rule is,

Observe which of the said Columns, hath the most Terms placed in it, and multiply all the Terms therein continually, and place the last Product for a Dividend; then

,

then multiply the Terms in the other Column continually, and let the last Product be a Divisor; then divide the said Dividend by the said Divisor, and the Quotient thence ari-

fing will be the Answer to the Question.

So the Example of the first of the said Cases being again repeated, viz. If 150 Pence at London make 3 Ducats at Naples, and 4? Ducats at Naples make 34? Shillings at Brussels, then how many Pence at London are equal to 138 Shillings at Brussels?

The Term being placed according to the 7th Rule, will

stand as followeth:

Pence at Lond. 150 3 Ducats at Naples.

Ducats at Nap. 44 341 Shillings at Bruffels.

Shill. at Bruff. 138

Again, Let the Example of the second Case be again repeated, viz. If 40 l. Averdupois-weight at London make 36 l. Weight at Amsterdam, and 90 l. at Amsterdam make 116 at Dantzick, then how many Pounds at Dantzick are equal to 112 l. Averdupois-weight at London?

The Terms' being disposed according to the 7th Rule

toregoing, will stand thus:

l. at London | 40 | 36 , l. at Amsterdam.
l. at Amsterdam | 90 | 116 | l. at Dantzick.
112 | l. at London.

whereby I find that the Terms under B multiply'd together, produce 497712 for a Dividend, and the Terms under A, viz. 40 and 90, produce 3600 for a Divisor, and Division being finished, the Quotient giveth 1293312 Pounds Dantzick for the Answer.

CHAP.

CHAP. XXXI.

Single Position.

3. TEgative Arithmetick, called the Rule of False, is that by which we find out a Truth, by Numbers invented or supposed, either Single or Double.

2. The Rule of Single Position, is, when at once, viz. by one false Position, or seigned Number, we find out the

true Number fought.

3 In the Single Rule of False, when you have made choice of your Position, work it according to the Tenor of the Question, as if it were the true Number sought; and if by the ordering your Position you find either the Result too much or too little, you may then find out the Number sought by this Proportion sollowing, viz.

As the Refult of your Position is to the Position, so is

the given Number to the Number fought.

Example.

Quest. 1. A Person having about him a certain Number of Crowns, said, It a 4th, 3d, and 6th of them were added together, they would make just 45 l. now I demand the Number of Crowns he had about him?

Anjmer, 60 Crowns.

To refolve this Question, I suppose he had 24 Crowns (or any other Number that will admit of the like Division) now the 4th of 24 is 6, and the 3 is 8, and the 6th is 4 all which Parts, (6, 8 and 4) being added together, make but 18, but it should be 45, wherefore I say by the Rule of Three.

As 18 the Sum of the Parts is to the Position 24, so is 45 the given Number to 60 the true Number sought.

For the 4th of 60 is 15, and the 3d of 60 is 20, and the 6th of 60 is 10, which added together make 45.

CHAP. XXXII.

Double Position-

1. THE Rule of double Polition is when two falle Politions are assumed to give a Resolution to the Question propounded.

2. When any Question is stated in double Position, make such a Cross as in the Margent,

3. Then make choice of any Number you d. L. think may be convenient for your working, which call your first Position, and place it at the End of the Cross at a; then work with this Polition, as if it were the true Number fought, according to the Nature of your Question; then having found out your Error, either too much or too little, place it on that Side the d, then make choice of another Number of the same Denomination with the first Position (which call your second Position) and place it on the Side of the Cros at b; then work with this Postion as with the former, and having found out your Error, either too much or too little, place it on that Side of the Crofs at c; and then the Politions will stand at the Top of the Crois, and the Errors at the Bottom, each under his correspondent Position, and then multiply the Errors into the Position cross-wife, that is, multiply the first Position by the second Error, and the second Position by the first Error, and put each Product over its Polition.

4. Having proceeded to far, then consider whether the Errors were both alike; that is, whether they are both too much, or both too little; and if they are alike; then subtract the lesser Product from the greater: and set the Remainder for a Dividend; then subtract the lesser Error from the greater, and let the Remainder be a Divisor, and the Quotient arising by this Division is the Answer

to the Question.

5. But if the Errors are unlike, that is one too much, and the other too little, then add the Products of the Pofitions and Errors together, and their Sum shall be a Dividend, then add the Errors together, and their Sum shall

be a Divisor, and the Quotient arising hence is the An-

Queft. 1. A, B and C built a House, which cost 76 l. of which A paid a certain Sum unknown, B paid as much as A, and 10 l. over, and C as much as A and B: Now I de-

fire to know each Man's Share in that Charge?

Having made a Cross according to the 2d Rule, I come according to the 3d Rule to make choice of my first Position, and here I suppose A paid 6 l. which I put upon the Cross as you see, then B paid 16 l. (for its said he paid 10 l. more than A) and C paid 22 l. (for it's said he paid as much as A and B) then I add their Parts.

HE NEW METERS OF THE SERVICE S

	_
20	Error 32

And they amount to 44, but it is faid they paid 76 l. wherefore there is 32 too little, which I note down at the Bottom of the Cross under its Position for the first Error.

2dly, I suppose A paid 9 l. then B paid 19 l. and C 28 l. all which added together make 56, but they should make 76, wherefore the Error of this Position is 20, which I put at the Bottom of the Cross under its Position for the 2d Error; then I multiply the Errors and Position Crosswife, viz. 32 (the Error of the first Position) by 9 (the 2d Position) and the Product is 288. Then I multiply 20, (the Error of the second Position) by 6 (the first Position)

Then (according to the 4th Rule) I subtract the lesser Product from the greater, viz. 120 from 288, because the Errors are both alike, (viz. too little) and there remaineth

and the Product is 120.

mainerh 168 for a Dividend; then I fabered 22 (the fer Error) from 32, the greater Error, and the Remain der is 12, for a Divisor; then I divide 168 by 12, and the Quotient is 14 for the Answer, which is the Share of A in the Payment.

6. Again 2dly, If the Errors had been both too big, it had had the same Effect, as appeareth by the following Work; for first, I suppose A paid 20 1. then B paid 20 L and C 50 l. which in all is 100 l. but it should have been no more than 76, wherefore the first Error is 24 too much. Again, I suppose A paid 18 /. then B must pay 28 1. and C must pay 46 1. which in all is 92 1. but it should have been but 76.

20 A		A 18

24 Error Error 16. wherefore the 2d Error is 16 too much; then I multiply 20 (the first Position) by 16 (the 2d Error) and the Product is 220; again, I multiply 18 (the 2d Polition) by 24 (the fieft Error) and the Product is 432. Then because the Errors are both too much, I subtract 320 (the leffer Product) from 432 (the greater Product) and there remainerh 112 for a Dividend; likewise I subtract 16 (the leffer Error) from 24 (the greater Error) and the Difference is 8 for a Divisor; then perform Division, and the Quorient is 14 (as before for the Answer.

Again, 3dly, If the Errors had been the one too big. and the other too little, Respect being had to the fifth Rule foregoing, the Answer would have been the same ; as thus, I take for my first Position 6, and then the Error is 32 too little; then I take for my fecond

Position 18, and then the Error is 16 too 96 672 57 much; then I multiply the Positions and 6 Errors crof -wife, and the Products are 96 48) and 576, and because the Errors are unlike, viz. one too big, and another too little, I add the Product 26 and 576 toge-

48

ther

eir Sum is 672 for a Dividend; I likewife the Errors 32 and 16 together, and their Sum is 48 for a Divisor; then having finished Division, I find the Quotiene to be 14, which is the Answer, as was found out at the two feveral Trials before.

> For Proof of the Work, I fay, If A paid -14 Then B paid 14 and 10 (that is) -24 Then C paid 14 and 24 (that is)-38 The Sum of all is - 76

which is the total Value of the Building, and equal to the

given Number.

Those who defire to see the Demonstration of this Rule. let them read the 7th Chapter of Mr. Kerfey's Appendix to Mr. Wingate's Arithmetick, Petifeus in the 5th Book of his Trigonometria, or Mr. Oughtred in his Clavis Mathematica.

Quest. 2. Three Persons, A, B, and C, thus discoursed together concerning their Age; quoth A, I am 18 Years of Age; quoth B, I am as old as A and half C; and quoth C, I am as old as you both, if your Years were added together. Now I defire to know the Age of each Perfon?

Answer. A is 18, B is 54, and C is 72 Years of Age.

Queft. 3. A Father lying at the Foint of Death, left to his three Sons, viz. A, B, and C, all his Estate in Money, and divideth it as followeth, viz. to A he gave half wanting 44 l. to B. he gave \(\frac{1}{2}\) and 14 l. over, and to C he gave the Remainder, which was 82 l. less than the Share of B; now I demand what was the Sum left, and each Man's Part ?

Answer. The Sum bequeathed was 588 1, wherefore A

had 250 1, B had 210 1. and C had 128 1.

Quest. 4. Two Persons, viz A and B had each in their Hands a certain Number of Crowns, and A said to B, If you give me one of your Crowns, I shall have five times as many as you; and faid B to him again, If you

A

in 10 ve ou ve give me one of yours, then we shall each of us have an equal Number; now I demand how many Crowns had each Person?

Answer. A had 4, and B had two Crowns.

Quest. 5. What Number is that unto which if I add 1—4th of it self, and from the Sum subtract 1 8—th of it self, the Remainder will be 216?

Anfwer. 192.

Many more Questions may be added, but these well understood, will be sufficient, (even for the meanest Capacity) for the Resolution of any other Question pertinent to this Rule.

There may be an Objection made, because we have not treated particularly upon Interest and Rebate; but the Operation of such Questions being more applicable to Decimals, are omitted, till we come to acquaint the Learner therewith.

LAUS DEO SOLI.

FINIS.

Edward Midwinter, at the Three Crowns and Looking-Glass in St. Paul's Church-Yard, formerly belonging to Ann Gissard in Old Bedlam, London.

THE History of the five Wise Philosophers, ro the wonderful Relation of the Life of Jehosaphas, Son of Avenerio, King of Barma in India.
